

Enzyme-based molecular techniques (part II) Polymerase chain reaction (PCR)

Prof. Mamoun Ahram

Challenges in research and medicine

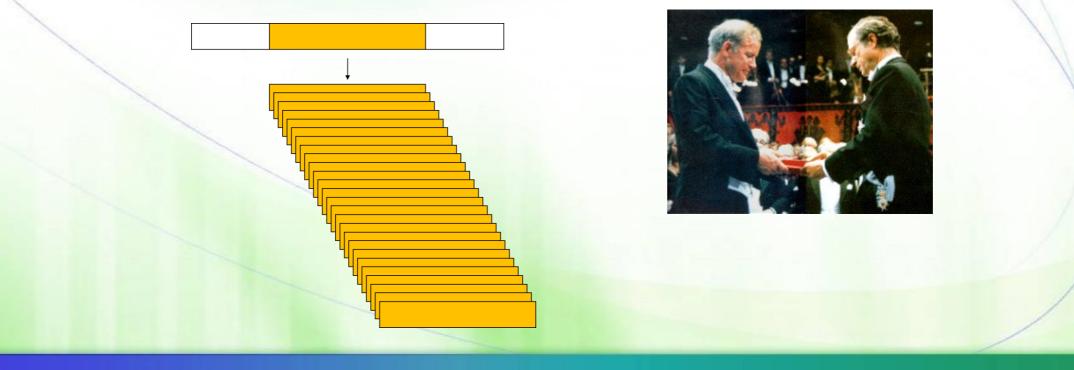

- STR, VNTR, SNPs, and mutations
- Minute amounts of genetic material
 - Dinosaurs and early humans
- Identification of organisms (e.g. infectious agents)

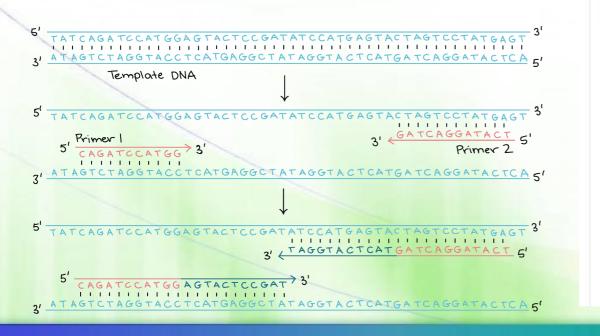

Polymerase Chain Reaction

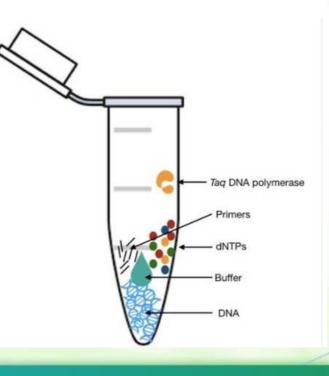

- Polymerase chain reaction (PCR) allows the DNA from a selected region of a genome to be amplified a billionfold, effectively "purifying" this DNA away from the remainder of the genome.
- It is extremely sensitive; it can detect a single DNA molecule in a sample.

Components of PCR reaction

- The DNA template
- A pair of DNA primers
 - The 15-25 nucleotides-long primers should surround the target sequence.
- All four deoxyribonucleoside triphosphates
- A heat-stable DNA polymerase

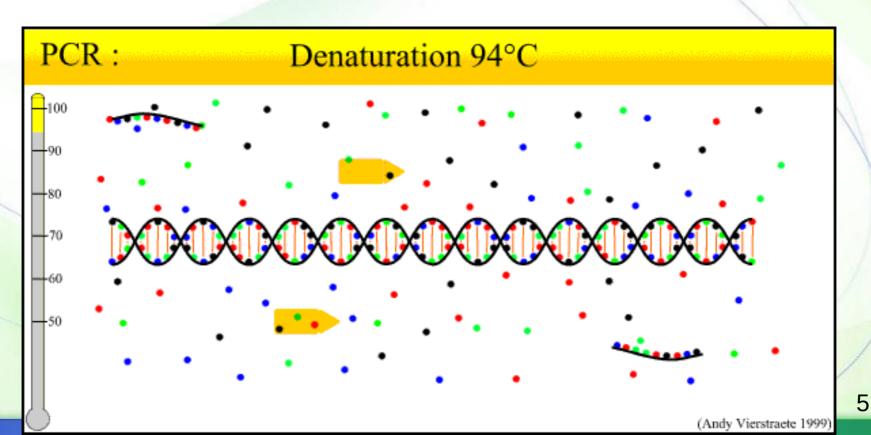

The PCR cycles

- Denaturation (at 95°C): DNA is denatured into single-stranded molecules.
- Annealing (50°C to 70°C): the primers anneal to the DNA.
- Polymerization or DNA synthesis (at 72°C): optimal for the polymerase.

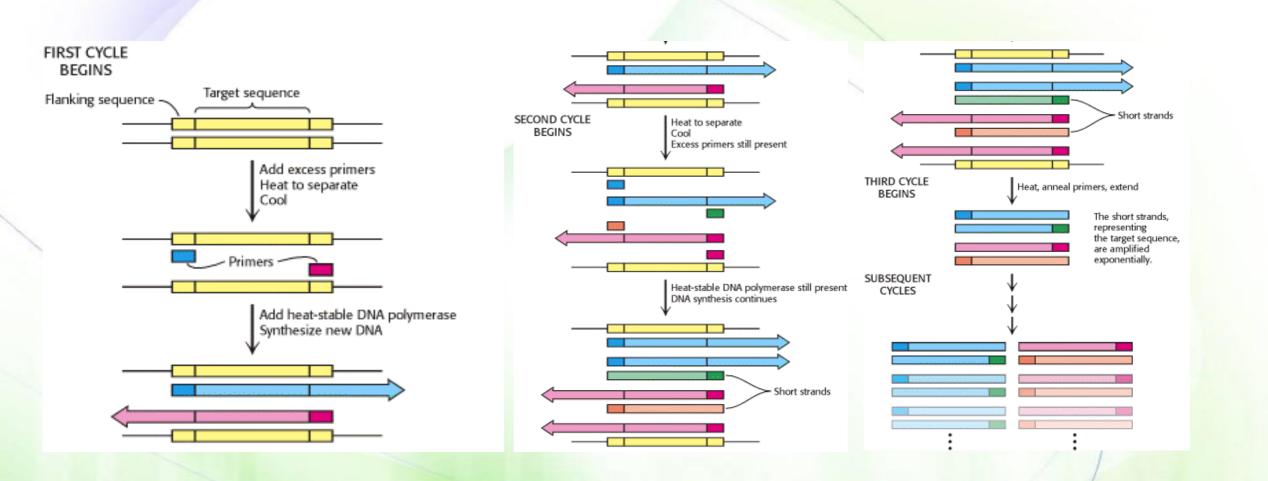

The DNA polymerase

- Suitably heat-stable DNA polymerases have been obtained from microorganisms whose natural habitat is hot springs.
- For example, the widely used Taq DNA polymerase is obtained from a thermophilic bacterium, Thermus aquaticus, and is thermostable up to 95°C.

PCR cycles

20-30 cycles of reaction are required for DNA amplification.

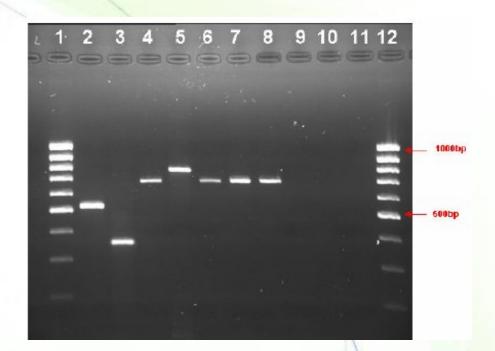

- the products of each cycle serving as the DNA templates for the next-hence the term polymerase "chain reaction".
- Every cycle doubles the amount of DNA.
- After 30 cycles, there will be over 250 million short products derived from each starting molecule.

Detection of DNA fragments

This DNA fragment can be easily visualized as a discrete band of a specific size by agarose gel electrophoresis.

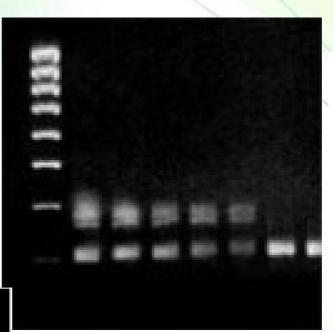

Importance of primers

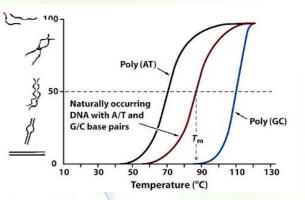

- The specificity of amplification depends on the specificity of the primers to not recognize and bind to sequences other than the intended target DNA sequences.
- How can you prevent it?

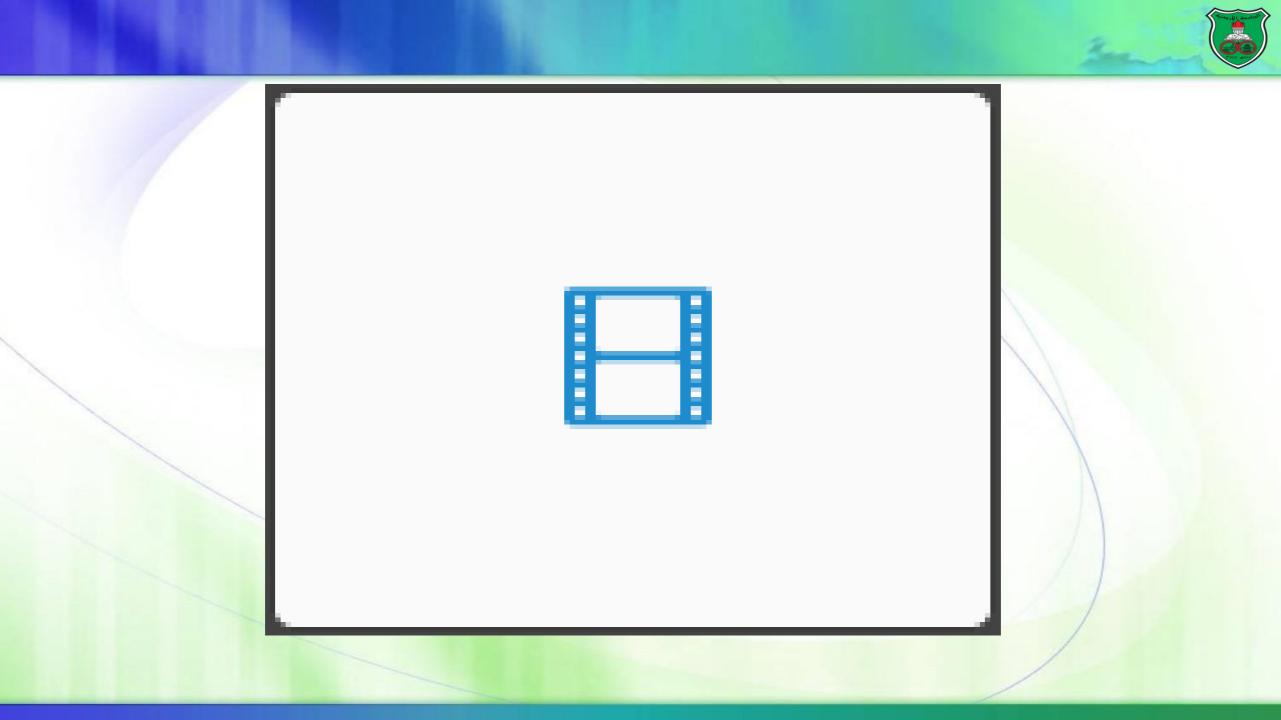

How can you take advantage of it?

Gradient temperature (°C) 49.6 50.6 52.3 54.2 55.5 57.2 58.4 61.2 62.3 64.6 66.4 66.3

Annealing temperature

Uses of PCR

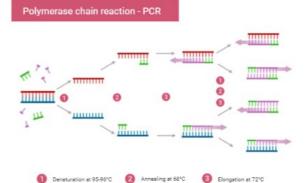

- Molecular fingerprinting
- Genotyping
- Genetic matching
- Detection of Mutations
- Prenatal diagnosis
- Cloning
- Detection of organisms
- Classification of organisms
- Mutagenesis
- Molecular archeology

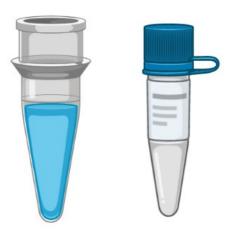

Types of PCR with definition and uses

- AFLP PCR
 Allele-specific PCR
 Alu PCR
 Assembly PCR
- 5. Asymmetric PCR
- 6. COLD PCR
- 7. Colony PCR
- 8. Conventional PCR
- 9. Digital PCR (dPCR)
- 10. Fast-cycling PCR
- 11. High-fidelity PCR
- 12. Hot-start PCR
- 13. In situ PCR
- 14. Intersequence-specific (ISSR) PCR
- 15. Inverse PCR
- 16. LATE (linear after the exponential) PCR
- 17. Ligation-mediated PCR
- 18. Long-range PCR

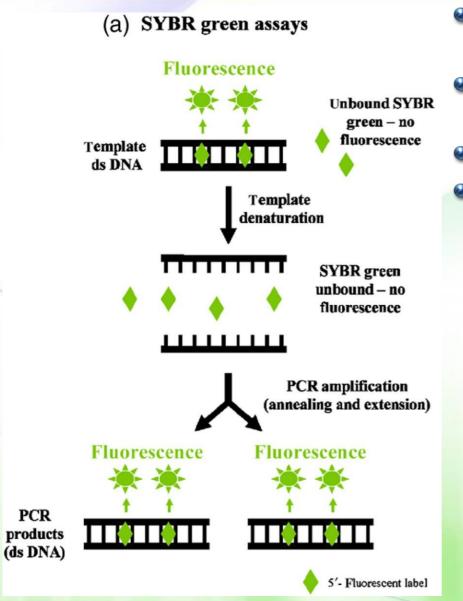

- 19. Methylation-specific PCR (MSP)
- 20. Miniprimer PCR
- 21. Multiplex-PCR
- 22. Nanoparticle-Assisted PCR (nanoPCR)
- 23. Nested PCR
- 24. Overlap extension PCR
- 25. Real-Time PCR (quantitative PCR or qPCR)
- 26. Repetitive sequence-based PCR
- 27. Reverse-Transcriptase (RT-PCR)
- 28. Reverse-Transcriptase Real-Time PCR (RT-qPCR)
- 29. RNase H-dependent PCR (rhPCR)
- 30. Single cell PCR
- 31. Single Specific Primer-PCR (SSP-PCR)
- 32. Solid phase PCR
- 33. Suicide PCR
- 34. Thermal asymmetric interlaced PCR (TAIL-PCR)
- 35. Touch down (TD) PCR
- 36. Variable Number of Tandem Repeats (VNTR) PCR

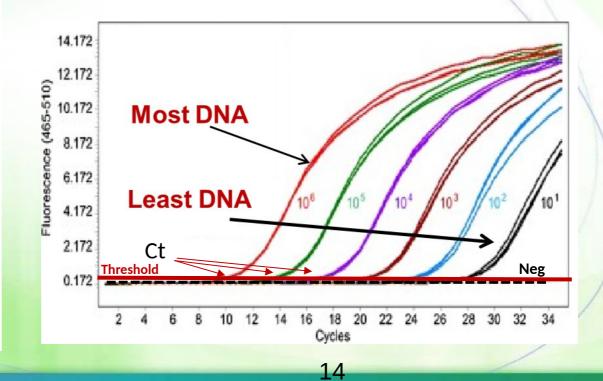

Real-time quantitative PCR (qPCR)

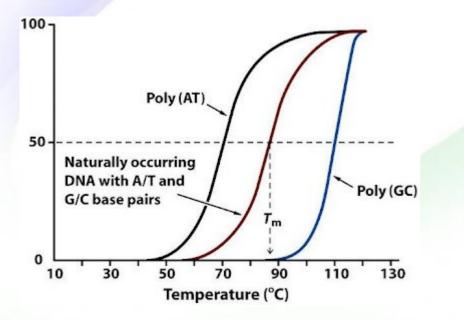

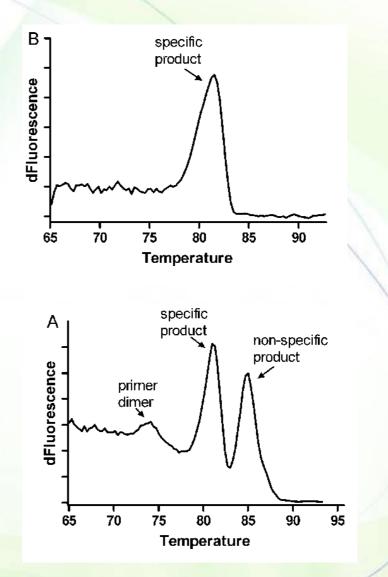

- SYBR green binds to double-stranded DNA and fluoresces only when bound.
- A way of relative quantitation of amount of DNA in a sample is by amplifying it in the presence of SYBR green.
- The higher the amount of DNA, the sooner it is detected.
- Threshold cycle (Ct) tells us at which cycle the signal is detected and is a measure of starting amount of DNA.

Melting curve analysis of qPCR

A melting curve charts the change in fluorescence observed when doublestranded DNA (dsDNA) with incorporated dye molecules dissociates, or "melts" into single-stranded DNA (ssDNA) as the temperature of the reaction is raised.

Taqman qPCR
