

- Clindamycin :-

- 10% absorbed

- Pseudomembranous colitis

- foam + hydrochloric formulation → irritation

- water based gel + lotion → well tolerated

- Erythromycin :-

- Antibiotic resistance can develop

- Metronidazole :-

- used in rosacea → blushing

- Parasitic infections

- Inhibitory effects on *Demodex* *bravis*

- anti-inflammatory effect → Inhibition of neutrophils

# systemic therapy

(Acne)

1) oral antibiotics:

→ Any drug ends with "cyclin"

- only Minocyclin is given orally once daily

2) Isotretinoin :-

- severe acne
- keratogenic
- photosensitive
- liver enzymes alteration
- hyperlipidemia
- Tumorigenic in animals
- dryness → severe
- arthralgias

- stabilizes lysosomes
- increases cAMP, cGMP
- increases PGE2
- increases thymidine in DNA
- RNA polymerase activity increases
- decreases cohesion between epidermal cells
- increases epidermal turnover
- increases collagen synthesis

# Psoriasis drugs

## 1) Acitretin :-

- vitamin A derivative
- orally - teratogenic
- Hepatotoxic

## 2) Tazarotene :-

- Topical
- anti proliferative, anti inflammatory
- Teratogenic  $\rightarrow$  retinoic acid derivative
- causes edema

## 3) Calcipotriene :-

- synthetic vitamin D<sub>3</sub> derivative.

## New drugs

## 4) Apremilast :- (Psoriasis + arthritis)

- used in immune related diseases
- selective inhibitor of (PDE4) enzyme
- Inhibition of TNF production from synovial cells.
- upper respiratory symptoms  $\rightarrow$  side effect

## 5) Deucravacitinib :-

- orally - adults - moderate - severe Psoriasis
- once daily - Inhibition of (TYK2)  
= Allosteric =

6) Roflumilast :- (cream)

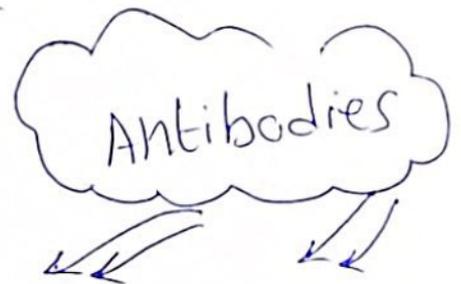

- long acting  $\rightsquigarrow$  chronic psoriasis
- Topical  $\rightsquigarrow$  cream - PDE4 inhibitor

7) Tapinarof :-

- Topical
- Immune modulator - skin normalization
- antioxidant - once daily

---

Biologic agent for psoriasis

1) Alefacept :- CD2 + IgG

2) Efalizumab :- IgG, PML, thrombocytopenia

3) Etanercept :- TNF + IgG

---

Depigmentation drugs

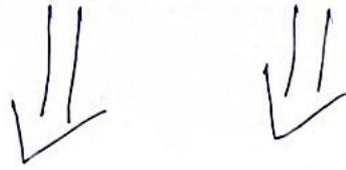

1) Hydroquinone

2) Monobenzene  $\rightarrow$  toxic to melanocytes

3) Mequinol  $\rightarrow$  tyrosinase inhibitor  $\rightarrow$  less melanin

## Pigmentation drugs

- 1) Trioxsalen
- 2) Methoxsalen

- photoactivated
- intercalate with DNA
- Skin cancer + cataract → side effects
- used in vitiligo

---

## Trichogenic drugs

- 1) Minoxidil :-

- anti-hypertensive drug
- used in androgenic alopecia

- 2) Finasteride :-

- $5\alpha$  reductase inhibitor
- Inhibition of testosterone conversion
- side effects related to sexual functions.

---

## Anti-trichogenic drugs

- 1) Eflornithine :-

- Inhibition of ornithine decarboxylase  
→ less polyamines → less hair growth
