Anatomy of the pelvis

<u>1- Bony pelvis, its joints and ligaments</u>

• The bony pelvis is formed of 4 bones :

• Right and left hip bones, the sacrum, and coccyx.

• They are united by 4 joints:

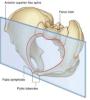

2 Sacro-iliac joints (plane synovial)
Symphysis pubis and sacrococcygal joints (cartilaginous joints).

o The pelvis is supported by 4 Ligament

o Iliolumbar, lumbosacral, sacrotuberous, and sacrospinous ligaments .

Normal position of the pelvis

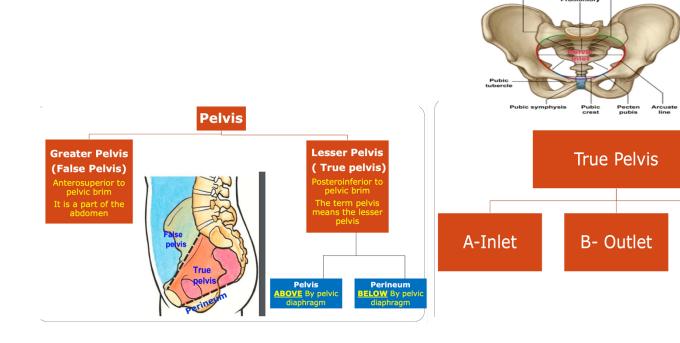

- In erect posture, the pelvis lies with the anterior superior iliac spine and pubic tubercles in the same vertical plane
- The ischial spine and upper border of symphysis pubis in the same horizontal plan.

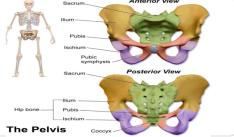

Linea terminal line)

The pelvic brim

 \circ An oblique plane extends from the sacral promontory to the upper margin of symphysis pubis.

C- Cavity

A- Pelvic inlet (pelvic Brim):

a. θ Shape:

- i. Male :Triangular or heart-shaped
- ii. Females : Transversely oval

b. θ Formation:

- i. Anteriorly :Symphysis pubis
- ii. **Posteriorly** :Sacral promontory
- iii. On either sides : Ala of sacrum , arcuate line, pectineal line, pubic crest

c. θ Diameters :

i. Anteroposterior diameter:

1. From sacral promontory to upper border of symphysis pubis (4 niches).

ii. Oblique diameter:

1. From the sacro-iliac joint to the opposite iliopubic eminence (4.5 inches).

iii. Transverse diameter:

- 1. Between the 2 arcuate lines (5 inches).
- 2. It is the **widest diameter**.

B- Pelvic Outlet :

a. **0 Formation**:

- i. Anteriorly: Pubic Arch.
- ii. **Posteriorly** : Coccyx.
- iii. Lateral angles : Ischial tuberosities.
- iv. Anterolateral sides : Ischiopubic rami
- v. Posterolateral sides : Sacrotuberous ligaments

b. θ Diameters :

i. Anteroposterior diameter:

- 1. Between the coccyx and lower border symphysis pubis (5 inches).
- 2. It is the widest diameter at the outlet.

ii. Oblique diameter :

1. From the midpoint of the sacrotuberous ligament to junction of the pubic and ischial rami of the opposite side (4.5 inches).

iii. Transverse diameter :

1. Between the 2 ischial tuberosities (4 inches).

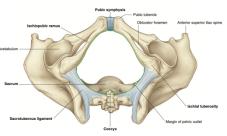

C- Pelvic Cavity

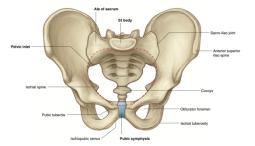

a. Anterior wall :

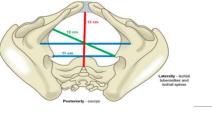

i. Is short (2 inches) Formed by bodies of pubic bones and symphysis pubis.

b. Posterior wall :

i. Is long (6 inches), Formed of the sacrum and coccyx

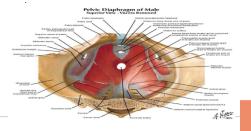

c. Lateral walls:

i. Pelvic surface of parts of pubis, ischium and ilium.

d. Subdivisions:

i. By pelvic diaphragm (levator ani and coccygeus muscles), It divided into pelvis above and perineum below.

	Anteroposterior	Oblique diameter	Transverse diameter
	diameter		
Inlet	4	4 1/2	5
Mid-cavity	4 1/2	4 1/2	4 1/2
Outlet	5	4 1/2	4
ion 			

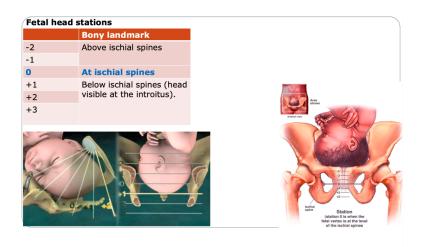

Diagonal conjugate :

- It is the distance between promontory of sacrum and the lower border of the symphysis pubis.
- Shorter diagonal conjugate indicates contracted pelvis.

Obstetric conjugate:

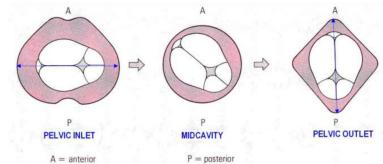

- o between promontory of sacrum and most bulging point on the back of symphysis pubis.
- \circ $\;$ It is less than Diagonal conjugate by 1.5 to 2 cm $\;$

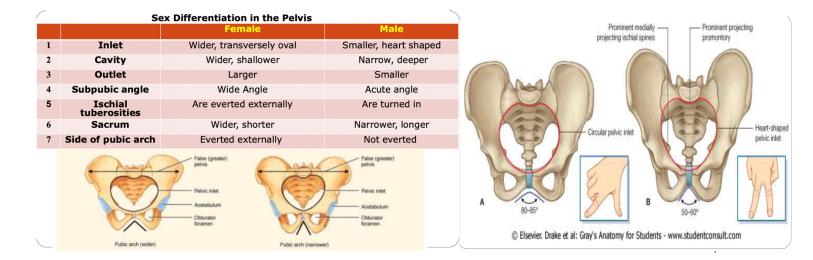

Rotation of head during labour

- Widest diameter of pelvic canal changes from transverse diameter at pelvic inlet to Anterior posterior diameter at pelvic outlet
- To obtain best fit of fetal head, the longest diameter of the fetal head passes through the widest diameter of the pelvis.
- o Therefore the head must rotate during labour

Types of Female pelvis

- Gynaecoid pelvis:
 - o it is the typical female pelvis previously described.
- Android pelvis:
 - o it is the female pelvis with some male features.
- Anthropoid pelvis:
 - it simulates the pelvis of apes. It has **Small transverse diameter** and long anteroposterior diameter.

• Platypelloid pelvis:

• it is a flat pelvis in which the inlet has **Larger transverse diameter** much than the anteroposterior diameter.

Fracture Pelvis

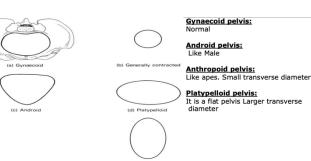

- o If the pelvis breaks at any one point, the fracture will be stable and no displacement will occur.
- o If two breaks occur in the pelvis the fracture will be unstable and displacement will occur

Coccydynia :

 is common and is usually caused by direct trauma to the coccyx, as in falling down a flight of concrete steps.

Complications of Pelvic Fractures

- o Injury to Male urethra and urinary bladder
- o Rectum rarely damaged
- Bleeding from blood vessels injury
- o Injury to nerves especially sciatic nerve in fracture include greater sciatic notch

2-Joints and ligaments Of The Pelvis

1) Pubic Symphysis:

a. It is a secondary cartilaginous joint between the two p

b. Ligament:

- i. Superiorly : Superior pubic ligament
- ii. Inferiorly : The arcuate pubic ligament.

2) Sacrococcygeal Joint:

a. Type: it is a secondary cartilaginous joint between sacral apex and coccygeal base.

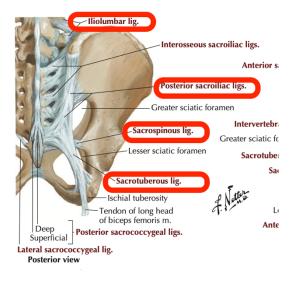

3) Sacroiliac Joint :

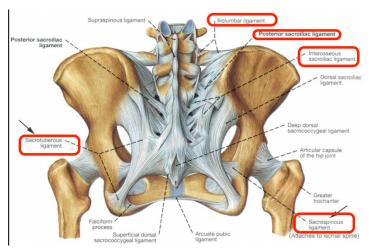

C.

- a. Type: plane synovial joint between sacral and iliac auricular surfaces.
- b. Ligaments :
 - i. The ventral sacroiliac ligament :
 - 1. it lies anteroinferior to the joint
 - ii. The interosseous sacroiliac ligaments :
 - 1. (the strongest ligament), lies posterior to the joint.
 - iii. The dorsal sacroiliac ligament:
 - 1. lies dorsal to the interosseous ligament

Movements and Functions:

- i. It transmits the body weight from lumbar spine to the hip bones.
- ii. It allows slight rotation around a horizontal axis when the trunk is flexed on the hip joints.

Lumbosacra

Anterior sacro-iliac ligamen

ligamen

Anterior longitudinal

lliolumbar lie

Trendelenburg Sign Drop of pelvis when lifting leg opposite to weak gluteus mediu:

Vertebropelvic ligaments:

- Iliolumbar ligament :
 - extends from the tip of the L5 transverse process to iliac crest.
- Lumbosacral ligament :
 - extends from the inferior aspect of L5 transverse process to the lateral part of the ala of sacrum.
- Sacrotuberous ligament:
 - o It extends between lower part of the sacrum and coccyx and ischial tuberosity.
- Sacrospinous ligament:
 - Extends from ischial spine to the lateral margins of sacrum and coccyx.

Functions of the Vertebropelvic Ligaments:

- The **iliolumbar** and **lumbosacral ligaments** prevent the anteroinferior displacement of L5 vertebra under effect of body weight.
- The **sacrotuberous** and **sacrospinous ligaments** convert the greater and lesser sciatic notches into foramina.
- o They also prevent the upward tilting of the lower part of sacrum under effect of body weight

Relaxation of Pelvic Ligaments and Increased Joint Mobility in Late Pregnancy

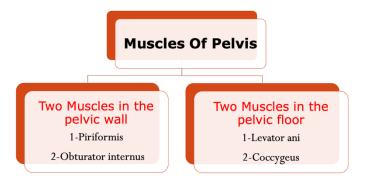

- Increased levels of sex hormones and the presence of the hormone relaxin cause the pelvic ligaments to relax during the last half of pregnancy.
- This allowing increased movement at the pelvic joints.
- Relaxation of the sacro-iliac joints and pubic symphysis permits as much as a 10–15% increase in diameters (mostly transverse, including the interspinous distance)
- The coccyx is also able to move posteriorly.
- \circ This is facilitating passage of the fetus through the pelvic canal.

("swayback") posture

 Relaxation of sacro-iliac ligaments permitting greater rotation of the pelvis and contributing to this posture

<u>3- Muscles Of the Pelvis</u>

FEMALE UROGENITAL SYSTEM (MIDSAGITTAL VIEW)

- Levator ani and coccygeus (of both sides) form the pelvic diaphragm which forms the pelvic floor
- The part of the pelvis **above** levator ani is the **pelvic** cavity.
- The part of the pelvis **below** levator ani is the **perineum**.
- The part of **obturator internus above** origin of levator ani is in the side wall of the pelvic cavity.
- The part of **obturator internus below** origin of levator is in the side wall of ischiorectal fossa of the perineum.
- Anterior borders of the 2 Levator ani muscles are separated by a gap which is filled by puboprostatic ligaments (in male) or pubovesical ligaments (in female).

Pelvic Fascia

• Piriformis fascia:

• is a part of parietal pelvic fascia Anteriorly related to it internal iliac vessels Posteriorly related to it sacral nerves

o Obturator fascia

- It covers the pelvic surface of obturator internus.
- It fuses with the periosteum at the margins of the muscle except at **obturator groove** where it passes below obturator nerves and vessels.
- Between the lower border of pubic body and ischial spine, the fascia thickens to form tendinous arch (**white line**) which gives origin for levator ani muscle.
- Below level of levator ani, the fascia lies in the lateral wall of ischiorectal and form the pudendal canal around the internal pudendal A. and pudendal N.

Levator ani

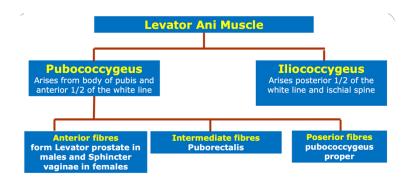

- Origin :
 - Lower part of back Body of pubis
 - White line of Obturator fascia
 - Pelvis surface of Ischial spine

• Nerve Supply :

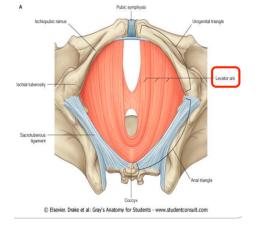

- On its pelvic surface :
 - fourth sacral N. (sacral plexus)
- On its perineal surface :
 - perineal branch (of pudendal N.)

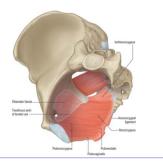

- 1-Supports and maintains the pelvic viscera in position.
- o 2-It resist the rise in intra pelvic pressure during the straining
- o 3-Sphincter action on the anorectal junction, and vagina.

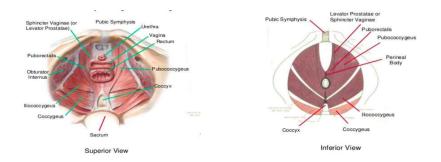

1- Levator prostatae or sphincter vaginae ;

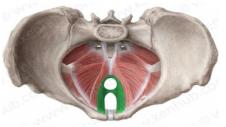

- a. It pass horizontally and backwards around the sides of prostate in male or sides of vagina in female to insert into the perineal body
- b. It supports the prostate , constrict the vagina and stabilize the perineal body.
- c. **Perineal Body** : is a mass of fibrous tissue, in front of the anal canal.
 - i. In the **male** : it lies between anal canal and bulb of the penis.
 - ii. In the **female** : it lies between anal canal and lower part of vagina.

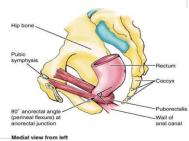

2. The puborectalis

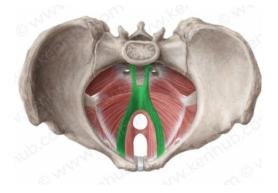

- It passes inferomedially to become continuous with the opposite ones behind the anorectal junction, so form a U-shaped sling.
- It is inserted into Anococcygeal body

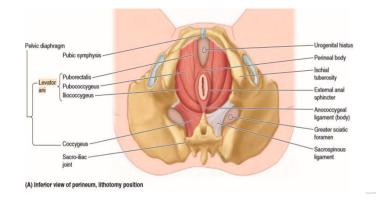

3-Pubococcygeus proper

- o It pass medially to be attached to side of coccyx and anococcygeal Body
- Anococcygeal body : A small fibrous mass between the tip of the coccyx and the anal canal.

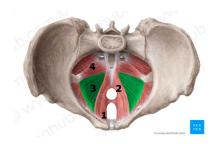

Iliococcygeus:

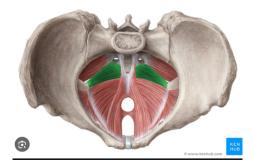

- \circ It arises from posterior 1/2 of the white line and ischial spine.
- Its fibres pass medially inferior to the pubococcygeus proper and has the same insertion into side of coccyx and the anococcygeal raphe.

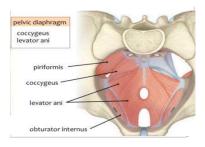

Coccygeus Muscle

- Origin : Ischial spine
- o Insertion : lower end of the sacrum and into the coccyx
- o Nerve supply: A branch of the 4th and 5th sacral nerves
- o Action: The two muscles assist the levatore ani in supporting the pelvic viscera.

Functional Significance of the Pelvic Floor in the Female

 \circ $\;$ It helps in head rotation during second stage of labour $\;$

Injury to the pelvic floor

- Can happen during a difficult childbirth
- o This leads to loss of support for the pelvic viscera leading to
 - Uterine and vaginal prolapse,
 - Herniation of the bladder (cystocele),
 - Alteration in the position of the bladder neck and urethra, leading to **stress incontinence** (patient dribbles urine whenever the intra- abdominal pressure is raised, as in coughing).
 - Prolapse of the rectum may also occur.
