## Pulmonary Embolism

/Pulmonary hypertension

Edited by: Ruaa Hdeib

Khaled Al Oweidat, MD

Introduction
Source of emboli
Pathogenesis & Risk factors
S&S
Management approach:
- Assess clinical probability
-Assess risk of mortality
-Investigation
* Diagnostic
*Non diagnostic ( helpful test)
-Treatment (medications and duration of treatment)

PE

• Partial or complete **occlusion** of a pulmonary arterial branch by blood clot(thrombus or multiple thrombi).

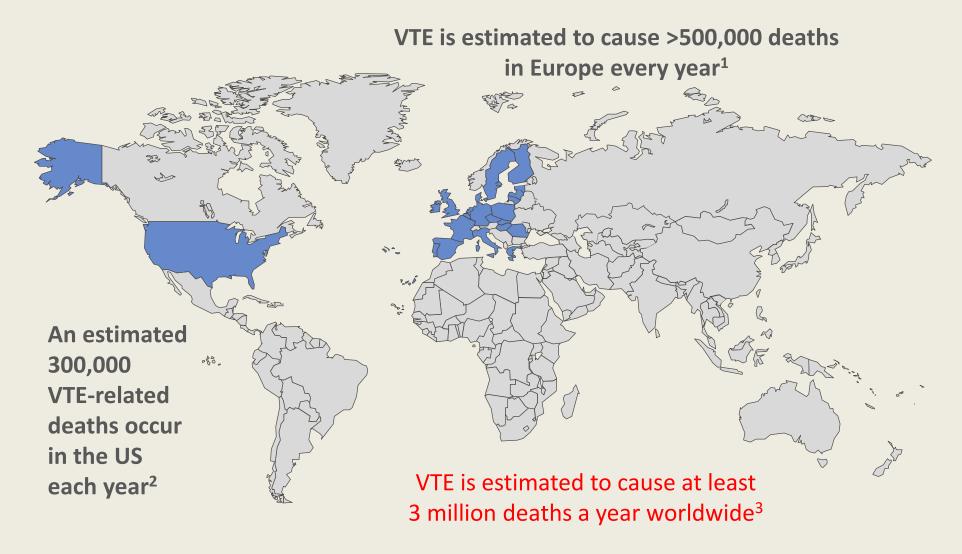

### Introduction

 Deep vein thrombosis and PE are different presentations of the same underlying pathophysiological event, venous thromboembolism (VTE).

```
bronchial circulation bleeding: severe, massive, life threatning pulmonary artery: Low pressure unless having severe pulmonary HTN approching the systemic BP
```

most of time from lover limbs

### VTE Is a Leading Cause of Death Worldwide

<sup>1.</sup> Cohen AT et al, Thromb Haemost 2007;98:756–764; 2. Heit JA et al, Blood 2005;106:Abstract 910;

<sup>3.</sup> ISTH Steering Committee for World Thrombosis Day J Thromb Haemost 2014;12:1580–1590

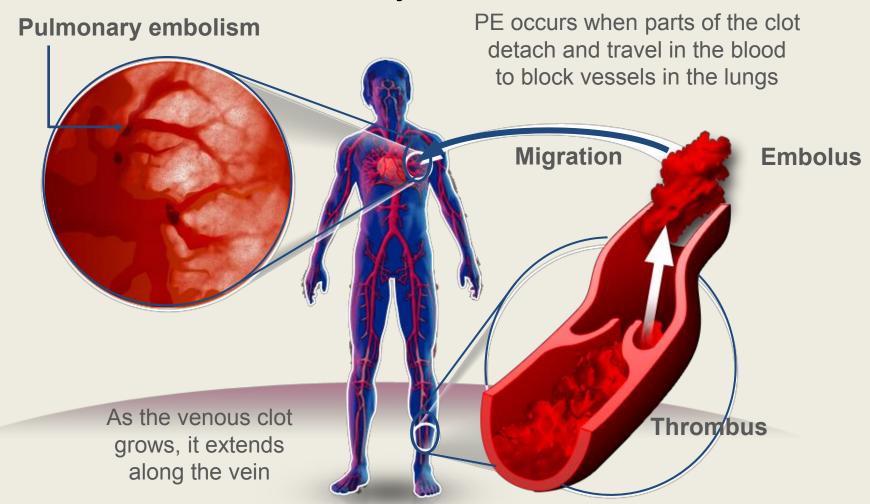

#### Thrombotic

 Most cases (80–95 percent) as a result of thrombus originating in the lower extremity

# Source of emboli

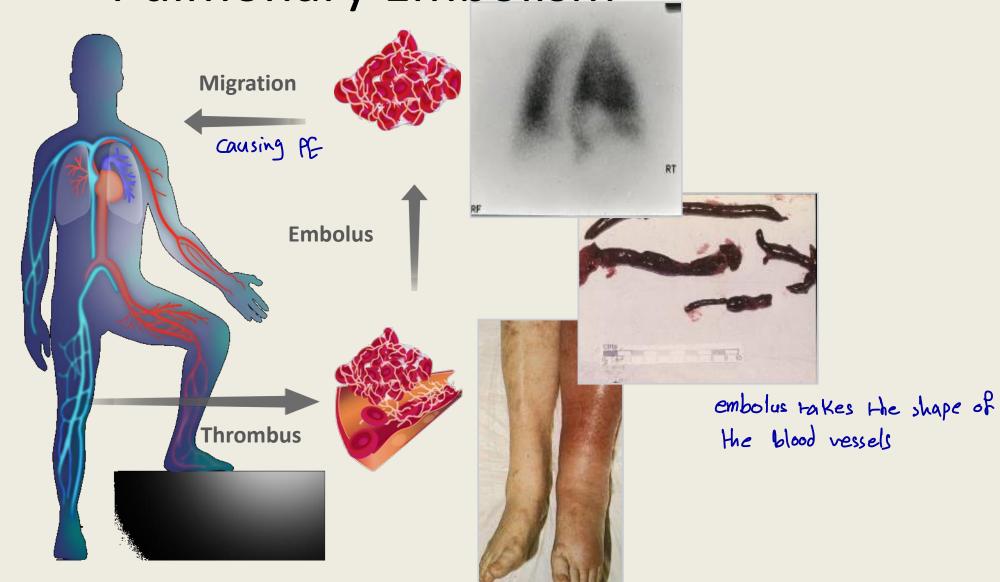

- Most thrombi originate in the deep veins of the calf and propagate proximally to the popliteal and femoral veins.
- Calf-limited(**below knee**) thrombi pose a minimal embolic risk
- Emboli may also originate from **atypical sites** such as upperextremity thrombosis associated with central venous catheters or \*intravascular cardiac 2\*devices, or may be associated with thoracic outlet obstruction or effort thrombosis

# VTE: Deep Vein Thrombosis and Pulmonary Embolism

VTE: Deep Vein Thrombosis and

#### **BOX 61-2 Causes of Nonthrombotic Pulmonary Emboli**

Fat Embolism Pt. with fracture & chest pain
Amniotic fluid embolism pregnant lady at Labour had amniotic fluid rupture
Air Embolism

- Venous
- Arterial

Tumor embolism Lumor 14se Septic pulmonary embolism

#### Table 3 Predisposing factors for VTE (1)

Strong risk factors (OR >10)

Fracture of lower limb

Previous VTE important

Spinal cord injury

Hospitalization for heart failure or atrial fibrillation/flutter (within previous 3 months)

Hip or kneereplacement

Majortrauma

Myocardial infarction (within previous 3 months)

VTE = venous thromboembolism.

888

#### Table 3 Predisposing factors for VTE (2)

#### Moderate risk factors (OR 2-9)

Arthroscopic knee surgery

Autoimmune diseases

Blood transfusion

Central venous lines

Intravenous catheters and leads

Chemotherapy

Congestive heart failure or respiratory failure

Erythropoiesis-stimulating agents

Hormone replacement therapy (depends on formulation)

VTE = venous thromboembolism.

0 N

#### **Table 3** Predisposing factors for VTE (3)

#### Moderate risk factors (cont'd)

In vitro fertilization

Oral contraceptive therapy  $\infty$ 

Postpartum period

Infection (specifically pneumonia, urinary tract infection, and HIV)

Inflammatory bowel disease

Cancer (highest risk in metastatic disease)

Paralytic stroke

Superficial vein thrombosis

Thrombophilia

VTE = venous thromboembolism.

@BC

#### Table 3 Predisposing factors for VTE (4)

#### Weak risk factors (OR < 2)

Bed rest >3 days

Diabetes mellitus \*

Arterial hypertension

Immobility due to sitting (e.g. prolonged car or air travel)

Increasing age

Laparoscopic surgery (e.g. cholecystectomy)

Obesity

Pregnancy

Varicose veins

VTE = venous thromboembolism.

0 N

**TABLE 61-1 Inherited Thrombophilias** 

	Prevalence (%)						
	Disorder	General Population	Patients with VTE	Inheritance	Relative Risk	Clinical Features	
X	AT deficiency	0.2	1–3	AD	20	VTE, heparin resistance most	thr
*	Protein C deficiency	0.2-0.4	3–5	AD	10	VTE	
*	Protein S deficiency	0.03-0.1	1–5	AD	10	VTE and ATE	
•	Factor V Leiden	5	10–50	AD	5	VTE and ATE most com	mon
*	Prothrombin G20210A	2–5	6–18	AD	3	VTE	
	Hyperhomocysteinemia	5	10	Not known	3	VTE and premature ASCVD	
	Elevated factor VIII	11	25	Not known	5	VTE	

(Data from Franchini M, Veneri D, Salvagno GL, et al: Inherited thrombophilia. Crit Rev Clin Lab Sci 2006;43:249–290.)

AT, Antithrombin; VTE, venous thromboembolism, ATE, arterial thromboembolism, ASCVD, atherosclerotic cardiovascular disease.

Once detached from their point of origin, emboli travel via the systemic venous system, through the right chambers of the heart, and eventually reach the pulmonary arterial system.

Asymptomatic -- -> collapsed death

Physiologic effects and clinical consequences of pulmonary thromboembolism vary widely, ranging from asymptomatic disease to hemodynamic collapse and death

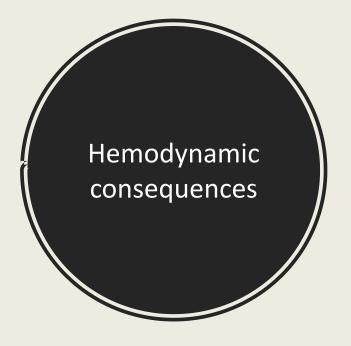

•	Major factors	that determine	the outcome	include:
---	---------------	----------------	-------------	----------

Size and location of emboli

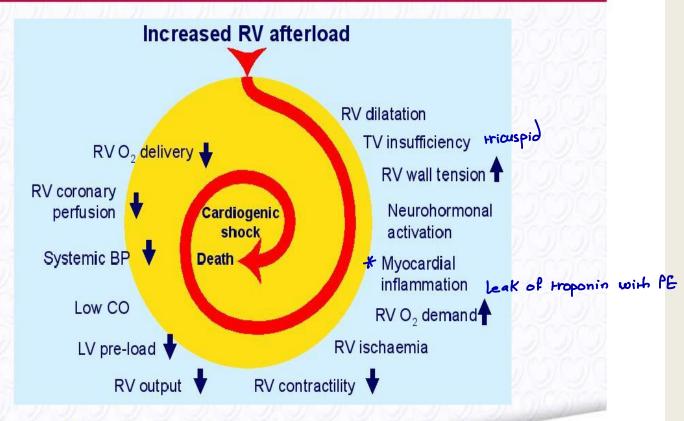

Coexisting cardiopulmonary diseases

Secondary humoral mediator release and vascular hypoxic responses

☐ The rate of **resolution** of emboli.

### Key factors contributing to haemodynamic collapse in acute pulmonary embolism

BP = blood pressure; CO = cardiac output; LV = left ventricular; RV = right ventricular; TV = tricuspid valve.

www.escardio.org/guidelines

European Heart Journal (2014):doi:10.1093/eurheartj/ehu283

# Gas exchange abnormality

- Gas exchange abnormalities...
  - Hypoxemia
  - Increased A-a gradient. Type 1 respiratory
  - V/Q mismatch improve with 02 failure
  - Increased dead space
  - Respiratory alkalosis from
     hyperventilation

- Often a sign of increased dead space and impaired minute ventilation
- may suggest massive PE

### S&S

<b>TABLE 61-3</b>	Frequency of Signs and Symptoms
	in Acute Pulmonary Embolism

commonest

	Symptoms	Frequency (%)
K	Dyspnea	73
ĺ	Pleuritic chest pain	66
	Cough	37
	Leg swelling	33
	Hemoptysis	13
	Wheezing	9
	Chest pain Pever	4
	Signs	
X	Respiratory rate ≥20/min	70
	Crackles	51
	Heart rate ≥100/min	30
	Third or fourth heart sound	26
	Loud pulmonary component of second heart sound	23
	Temperature > 38.5° C	7
	Pleural rub	3

## TABLE 61-2 Differential Diagnosis of Acute Pulmonary Embolism

Pneumonia or bronchitis	Rib fracture
Asthma or exacerbation of chronic obstructive lung disease	Pulmonary edema/ Congestive heart failure
Pleuritis	Thoracic malignancy
Pericarditis/Cardiac tamponade	Pulmonary hypertension
Pneumothorax	Myocardial infarction
Musculoskeletal pain	Aortic dissection
Costochondritis	Anxiety

# Management approach

- Assess clinical probability
- Assess risk of mortality
- Investigation
  - Diagnostic
  - Non diagnostic (helpful test)
- Treatment (medications and duration of treatment)

#### Assessment of pre-test probability

Clinical prediction rules for pulmonary embolism				
	Clinical decision rule points			
Wells rule	Original version	Simplified version		
Previous PE or DVT	1.5	1		
Heart rate ≥100 b.p.m.	1.5	1		
Surgery or immobilization within the past 4 weeks	1.5	1

PE unlikely	0-5	0-2		
PE likely	≥6	≥3		

# Assess risk of mortality

#### High Risk:

- Hemodynamically Unstable.
- Early mortality is 15%. can 90 4p 10 35%
- Non-High Risk

(According to RVD and Myocardial injury)

- Intermediate Risk
- Low Risk

#### Table 4 Definition of haemodynamic instability

Massive PE = PE + haemodynamic instability

(1) Cardiac arrest	(2) Obstructive shock	(3) Persistent hypotension
cardiopulmonary required to achieve a BP ≥90 n	Systolic BP <90 mmHg, or vasopressors required to achieve a BP ≥90 mmHg  **despite adequate filling status ************************************	Systolic BP <90 mmHg, or systolic BP drop ≥40 mmHg, either lasting longer than 15
	And	minutes and not caused by new- onset arrhythmia,
	End-organ hypoperfusion (altered mental status; cold, clammy skin; oliguria/anuria; increased serum lactate)	hypovolaemia, or sepsis  العدية ١٩٥١مه عنفه  العدية ١٩٥١مه عنفه

Lamore than 40 drop in the systolic

#### Table 8 Original and simplified PESI (1)

Parameter	Original version	Simplified version	
Age	Age in years	1point (if age >80 years)	
Male sex	+10 points male		
Cancer	+30 points	1point	
Chronic heart failure	+10 points	4	
Chronic pulmonary disease	+10 points	1point	
Pulse rate ≥110b.p.m.	+20 points	1point	
Systolic BP <100 mmHg	+30 points	1point	

BP = blood pressure; PESI = Pulmonary Embolism Severity Index.

000

#### Table 8 Original and simplified PESI (2)

Parameter	Original version	Simplified version
Respiratory rate >30 breaths per min	+20 points	
Temperature <36 °C	+20 points	
Altered mental status	+60 points	
Arterial oxyhaemoglobin saturation <90%	+20 points	1point

PESI = Pulmonary Embolism Severity Index.

#### Table 8 Original and simplified PESI (3)

Riskstrata	
Class I: ≤65 points  very low 30-day mortality risk (0–1.6%)  Class II: 66–85 points  low mortality risk (1.7–3.5%)	<b>0 points</b> = 30-day mortality risk 1.0% (95% CI 0.0–2.1%)
Class III: 86–105 points moderate mortality risk (3.2–7.1%) Class IV: 106–125 points high mortality risk (4.0–11.4%) Class V: >125 points very high mortality risk (10.0–24.5%)	≥1point(s) = 30-day mortality risk 10.9% (95% CI 8.5–13.2%)

 ${\sf PESI} = {\sf Pulmonary} \, {\sf Embolism} \, {\sf Severity} \, {\sf Index}.$ 

a D

#### Table 9 Classification of PE based on early mortality risk

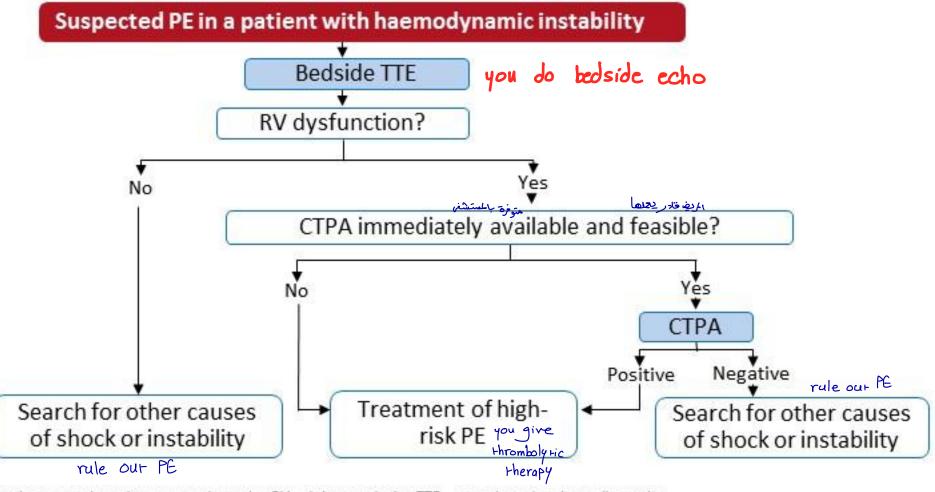

Early mortality risk		Indicators of risk			
		Haemo- dynamic instability	Clinical parameters of PE severity/ comorbidity: PESI III–Vor sPESI≥1	الصورة الطبقية الجهة ليميه أكبر مسم التشمال TS dysfunction on TTE or CTPA	Elevated cardiac troponin levels
High		+ )	(+)	+	(+)
Interme- diate	Intermediate-high	-	+	+	+
	Intermediate-low	-	+	One (or none) positive	
Low			:#:	<b></b>	Assessment optional; if assessed, negative

CTPA = computed tomography pulmonary angiography; PESI = Pulmonary Embolism Severity Index; TTE = transthoracic echocardiography.

#### Figure 3 Diagnostic algorithm for suspected high-risk PE

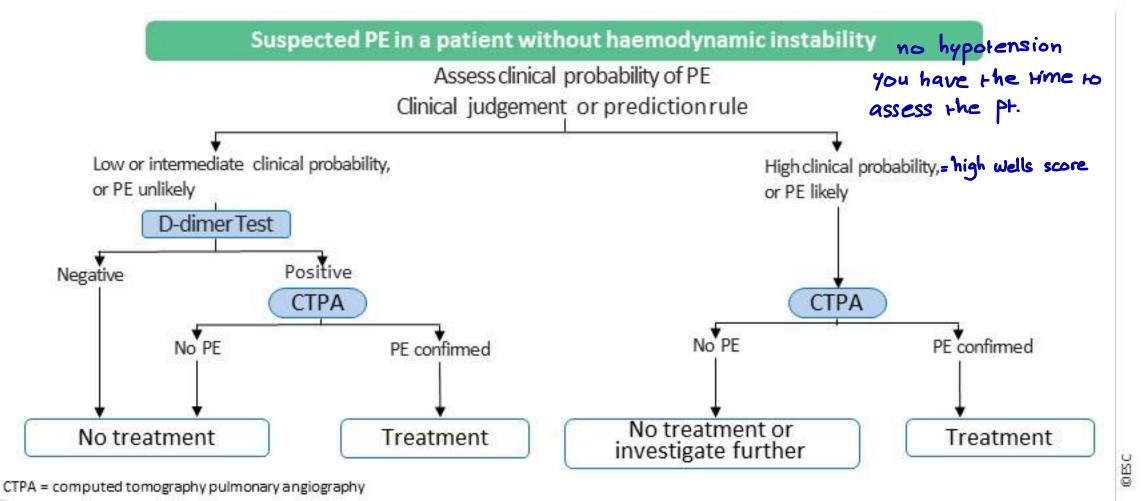

CTPA = computed tomography pulmonary angiography; RV = right ventricular; TTE = transthoracic echocardiography

## Figure 4 Diagnostic algorithm for suspected PE without haemodynamic instability

### Diagnostic investigation

#### D-dimer

- Non specific measure of fibrinolysis
- High sensitivity (positive in presence of dx)
- High negative predictive value (dx is absent when test is negative) in the outpatient setting
- -Useful in outpatient setting/emergency room, not an inpatient test for ruling out PE
- Need to be adjusted with age the optimal age-adjusted cut-off was defined as the patient's age multiplied by 10 in patients aged ≥ 50 years.

Currently reserved for

V/Q scan

- Renal impairment
- IV contrast allergies
- Pregnancy
- Hospital resources

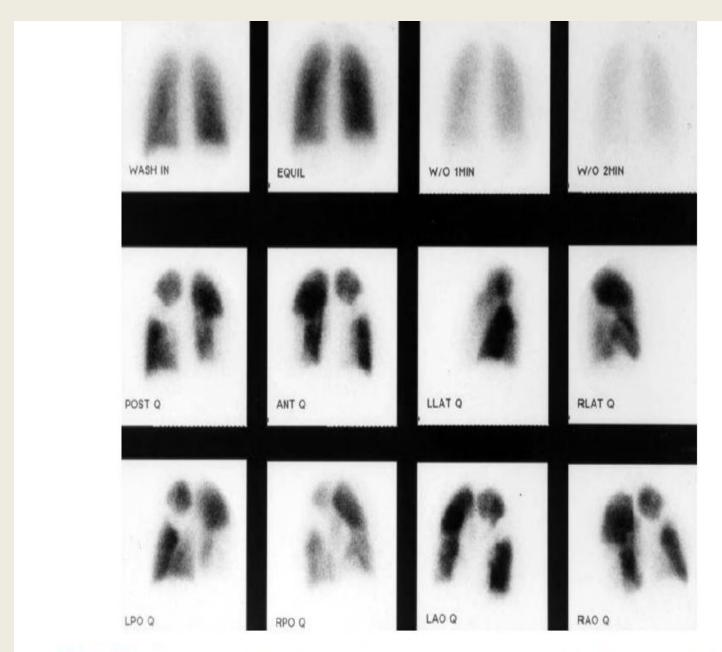

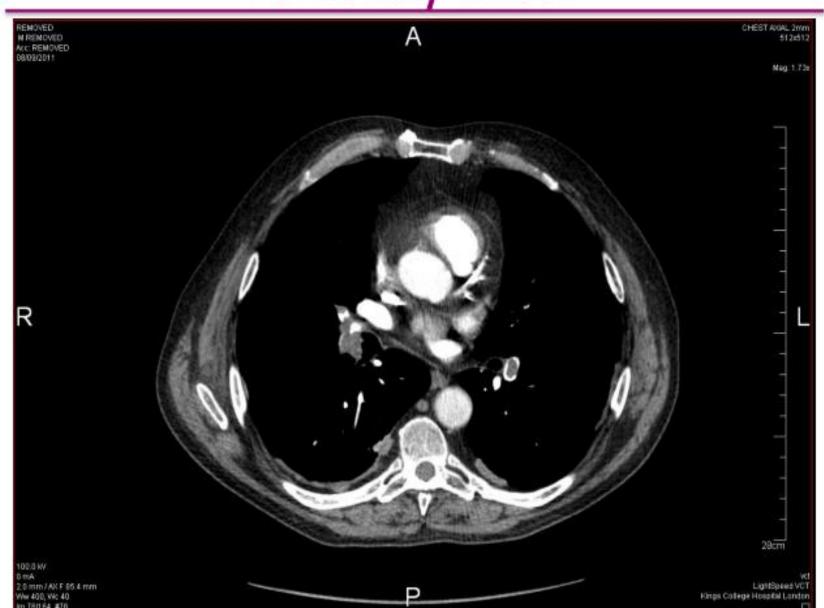

Figure 82-9 "High probability" ventilation/perfusion scan demonstrating normal ventilation and multiple mismatched segmental and larger defects.

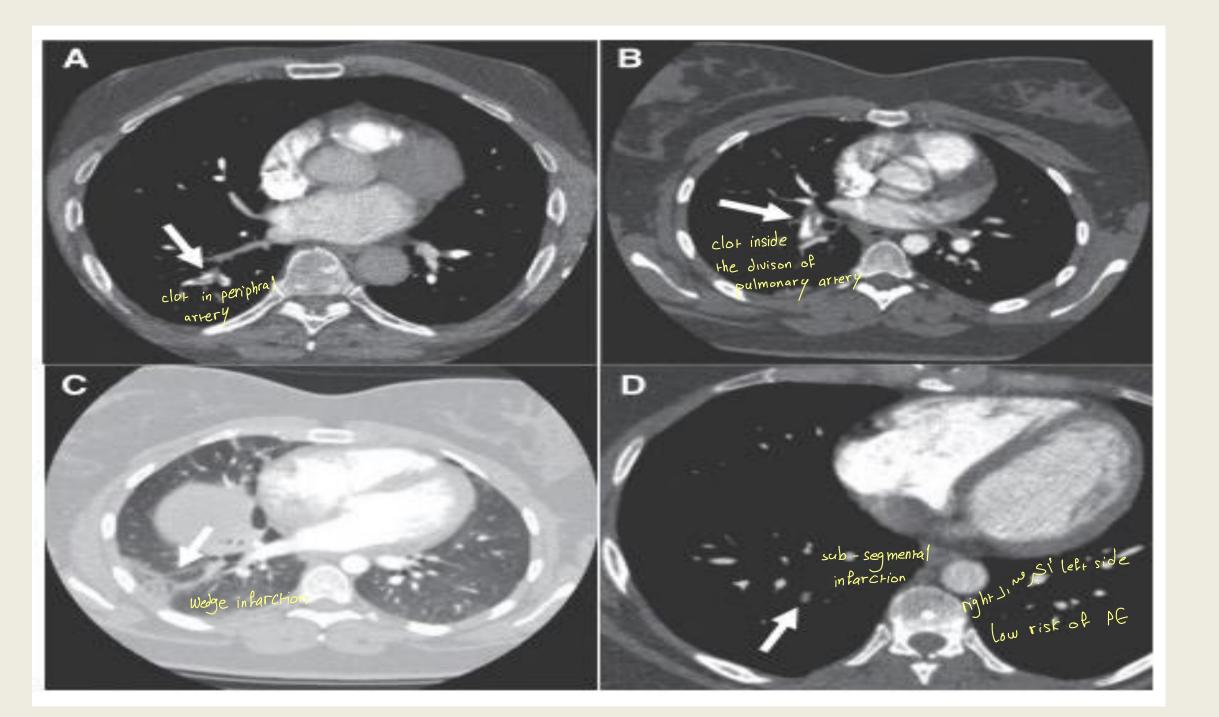

#### **Spiral CT**

# CT with PE protocol

- Larger dose of Contrast
- Rapid rate(timed) of contrast
- Effective dose at pulmonary CT angiography, without significant loss of objective or subjective image quality.

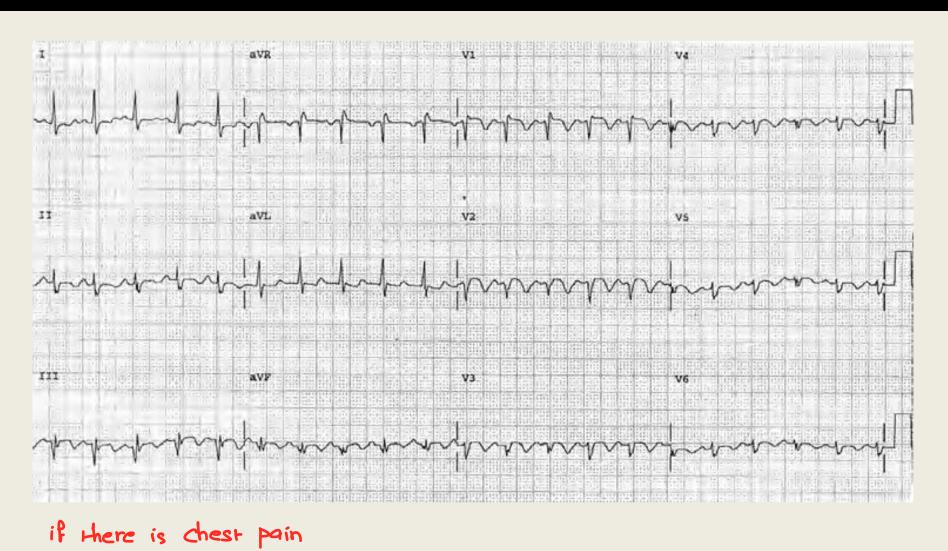

### Pulmonary Emboli

#### specific but not sensitive

Electrocardiogram demonstrating findings consistent with embolism including sinus tachycardia, incomplete right bundle branch block, S1Q3T3 pattern, and inverted precordial T waves.(minority of patients)

#### **Others**

· CXR: useless // to rule out other causes

Most patients with pulmonary embolism have abnormal

but nonspecific chest radiographic findings

Echocardiogram:

Suspected massive pulmonary embolism who are too ill for transportation or

have an absolute contraindication to the administration of a contrast agent.

• Troponin:

Increase in right heart strain.

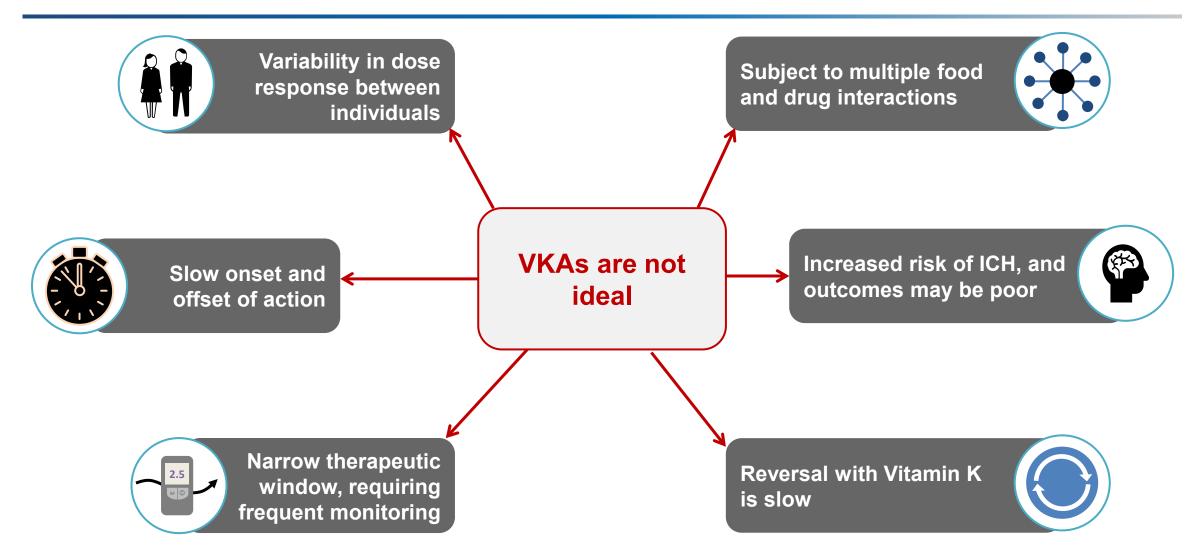

#### **Treatment**

Three phases: Initiation phase (5-21 days): The initial provision of anticoagulants following VTE diagnosis, Treatment phase (3 months): The period after initiation that completes treatment for the acute VTE event, Extended phase (3 months-no planned stop date): The period of anticoagulant use at full or reduced dose for the goal of secondary prevention

- Most recent 2016 ATS guidelines, ECS 2019, ASH 2020, 2021 ATS update NOACs become
  the recommended oral treatment and alternative is VKAs(warfarin).
- ECS2019 recommends decrease dose of NOACs after 3-6months of treatment while ASH
  you can use full or reduced dose of NOACs. ATS 2021 update recommends decrease the
  dose of NOACs after 3 months of treatment(treatment phase)

ATS: American Thoracic Society ESC: European Society of Cardiology ASH: American Society of Hematology NOAC: Novel Oral Anticoagulants VKA: Vitamin K Antagonist

#### VKAs were the cornerstone of anticoagulation but they have multiple limitations

ICH, intracranial hemorrhage

TABLE 1 Non-Vitamin K-Dependent Oral Anticoagulant Agents in the Treatment and Secondary Prevention of VTE

The state of the s					
	Dosage and Interval				
	Initial Phase	Long-Term Phase	Extended Phase	Not Recommended or Contraindicated*	
Rivaroxaban†	15 mg twice daily with food for 21 days	20 mg once daily with food		<ul> <li>CrCl &lt;30 ml/min</li> <li>Moderate or severe hepatic impairment (Child-Pugh B and C), or hepatic disease associated with coagulopathy</li> <li>Concomitant use of combined P-gp and strong CYP3A4 inhibitors or inducers</li> </ul>	
Dabigatran etexilate‡	Initial therapy with parenteral anticoagulation for 5-10 days should precede administration of dabigatran etexilate	150 n	ng twice daily	<ul> <li>CrCl &lt;30 ml/min</li> <li>Concomitant treatment with P-gp inhibitors in patients with CrCl &lt;50 ml/min</li> <li>Concomitant treatment with P-gp inducers (i.e., rifampin)</li> </ul>	
Apixaban	10 mg twice daily for 7 days		mg twice daily after at least 6 months of treatment	<ul> <li>CrCl &lt;15 ml/min</li> <li>Severe hepatic impairment (Child-Pugh C), or hepatic disease associated with coagulopathy</li> <li>Strong dual inhibitors or inducers of CYP3A4 and P-gp</li> </ul>	
Edoxaban§	Initial therapy with parenteral anticoagulation for 5-10 days should precede administration of edoxaban	with ≥1 of the follo 15-50 ml/min; body concomitant use of	weight ≤60 kg;	<ul> <li>CrCl &lt;15 ml/min</li> <li>Moderate or severe hepatic impairment (Child-Pugh B and C), or hepatic disease associated with coagulopathy</li> <li>Concomitant treatment with rifampin</li> </ul>	

# NOACs are not used

- CKD with Ccl less than 30 ml/min (apixaban & edoxaban can be used Ccl bet.15-30 ml/min with reduced dose)
- Moderate to severe hepatic impairment
- Pregnancy and lactation:
   Still the use of LMWH is the standard of care in pregnant lady and VKAs can be used in lactating women
- PE with cancer:

LMWH NOACs

 Antiphospholipid syndrome : not proved yet

# Risk Factors Associated with VTE Recurrence

- Idiopathic presentation<sup>1,2</sup>
- Presentation of primary DVT<sup>1</sup>
- Increasing age<sup>1</sup>
- Proximal DVT<sup>2</sup>
- Cancer<sup>2</sup>
- Residual thrombus mass<sup>3</sup>
- Male gender<sup>4</sup>
- High-risk thrombophilia<sup>1</sup>
- Scoring systems such as the DASH score, the Vienna Prediction Model, and the 'Men continue and HERDOO2' score are used to predict PE.

<sup>3.</sup> Prandoni P et al, Ann Intern Med 2002;137:955–960; 4. Eichinger S et al, Circulation 2010;121:1630–1636

According to ATS 2016

Provoked PE by a surgical or nonsurgical transient risk factor, treatment for 3 months (Grade 1B)

#### ➤ first unprovoked PE with:

(i) **low or moderate bleeding extended anticoagulant therapy** (no scheduled stop date) over 3 months of therapy (Grade 2B)

(ii) **high bleeding risk**) 3 months of anticoagulant therapy over extended therapy (no scheduled stop date)
(Grade 1B).

### Special cases

Just Know

1. Patients with isolated subsegmental pulmonary embolism(PE):

Rule out proximal deep venous thrombosis (e.g., with ultrasonography). If risk for recurrent VTE is low, surveillance is recommended over anticoagulation. If risk for recurrent VTE is high, anticoagulation is recommended

2. Patients with isolated distal DVT, without severe symptoms or risk

factors for propagation (including markedly elevated D-dimer, extensive thrombosis, thrombosis close to the proximal veins, no reversible provoking factor, active cancer, inpatient hospitalization, and history of VTE), serial imaging with duplex ultrasonography is recommended

## Just Know

- 3. PE and Cancer patients:
- LMWH NOACs
- DOACs is now is alternative to LMWH for the treatment of cancer-associated VTE(except GI cancer)
- 4. Antiphospholipid syndrome:
- Still VKA
- 5. Use of IVC filter:
- Routine use is not recommended
- In case of failure of anticoagulation or acute PE with absolute contraindication to anticoagulation (upper Gl bleeding)

#### ➤ Second unprovoked PE:

- -Low risk of bleeding: extended anticoagulation (1B)
- -Moderate risk of bleeding : extended anticoagulation (1B)
- -High risk of bleeding: 3 months (1B) you can start aspirin

➤In patients with an unprovoked PE who are stopping anticoagulant therapy(high risk of bleeding or refused to take it) with no contraindication to aspirin

suggest aspirin may be better then? over no aspirin to prevent recurrent PE (Grade 2B).

better than nothing

#### Pulmonary hypertension

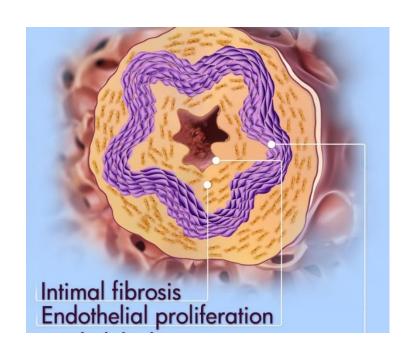

- ☐ Pulmonary Hypertension : presence of abnormally high pulmonary vascular pressure.
- PAH, a category of PH and is defined as:
  Pulmonary arrerial hypertension
- \* Mean PAP of greater than 25 mm Hg at rest Pulmonary arrery pressure
- \* Normal pulmonary arterial wedge pressure of 15 mm Hg or less so it's nor a cardiac cause
- \* PVR greater than 3 Wood units
  Pulmonary vascular resistance

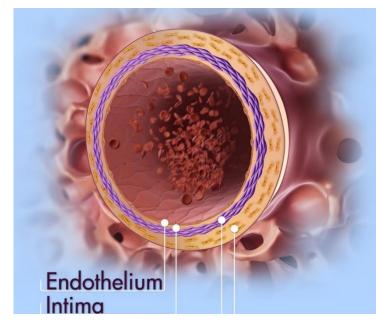

#### Haemodynamic definitions of pulmonary hypertension

Definition	Haemodynamic characteristics		
PH	mPAP >20 mmHg		
	mPAP >20 mmHg		
Pre-capillary PH	PAWP ≤15 mmHg		
	PVR >2 WU		
	mPAP >20 mmHg		
Isolated post-capillary PH	PAWP >15 mmHg		
	PVR ≤2 WU		
Combined nest and nes	mPAP >20 mmHg		
Combined post- and pre- capillary PH	PAWP >15 mmHg		
Саршагу РП	PVR >2 WU		
Exercise PH	mPAP/CO slope between rest and exercise >3 mmHg/L/min		

Pulmonary remodelling in PAH leads to narrowing of the artery<sup>1</sup>

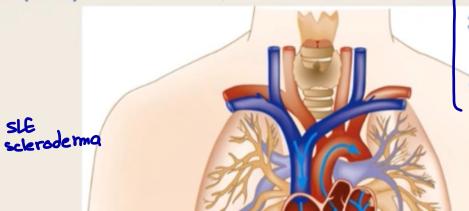

- PAH, pulmonary arterial hypertension; SMC, smooth muscle cell.
- 1. Figure adapted from Galiè N, et al. Eur Heart J 2010; 31:2080-6.

#### We give treatment

#### 1. Pulmonary arterial hypertension (PAH) arterial or not?

- 1.1 Idiopathic PAH
- 1.2 Heritable PAH
- 1.3 Drug and toxin induced
- 1.4 PAH associated with:
  - 1.4.1 Connective tissue disease SLE
  - 1.4.2 HIV infection
  - 1.4.3 Portal hypertension
  - 1.4.4 Congenital heart disease
  - 1.4.5 Schistosomiasis
- 1.5 PAH long-term responders to CCBs
- 1.6 PAH with overt features of venous/capillaries involvement
- 1.7 Persistent PH of the newborn syndrome

#### treat the underlying cause

- 2. PH due to left heart disease
- 3. PH due to lung disease and/or hypoxia
- 4. PH due to pulmonary artery obstructions CTEF
  - 5. PH with unclear and/or multifactorial mechanisms
    - 5.1 Haematological disorders
    - 5.2 \$ystemic and metabolic disorders
    - 5.3 Others
    - 5.4 Complex congenital heart disease

#### Clinical classification of pulmonary hypertension (1)

#### **GROUP 1 Pulmonary arterial hypertension (PAH)**

- 1.1 Idiopathic
  - 1.1.1 Non-responders at vasoreactivity testing
  - 1.1.2 Acute responders at vasoreactivity testing
- 1.2 Heritable
- 1.3 Associated with drugs and toxins
- 1.4 Associated with:
  - 1.4.1 Connective tissue disease
  - 1.4.2 HIV infection
  - 1.4.3 Portal hypertension
  - 1.4.4 Congenital heart disease
  - 1.4.5 Schistosomiasis
- 1.5 PAH with features of venous/capillary (PVOD/PCH) involvement
- 1.6 Persistent PH of the newborn

#### Clinical classification of pulmonary hypertension (2)

#### **GROUP 2 PH associated with left heart disease**

- 2.1 Heart failure:
  - 2.1.1 with preserved ejection fraction
  - 2.1.2 with reduced or mildly reduced ejection fraction
- 2.2 Valvular heart disease
- 2.3 Congenital/acquired cardiovascular conditions leading to post-capillary PH

#### **GROUP 3 PH associated with lung diseases and/or hypoxia**

- 3.1 Obstructive lung disease or emphysema
- 3.2 Restrictive lung disease
- 3.3 Lung disease with mixed restrictive/obstructive pattern
- 3.4 Hypoventilation syndromes
- 3.5 Hypoxia without lung disease (e.g. high altitude)
- 3.6 Developmental lung disorders

©ESC/ERS

#### Clinical classification of pulmonary hypertension (3)

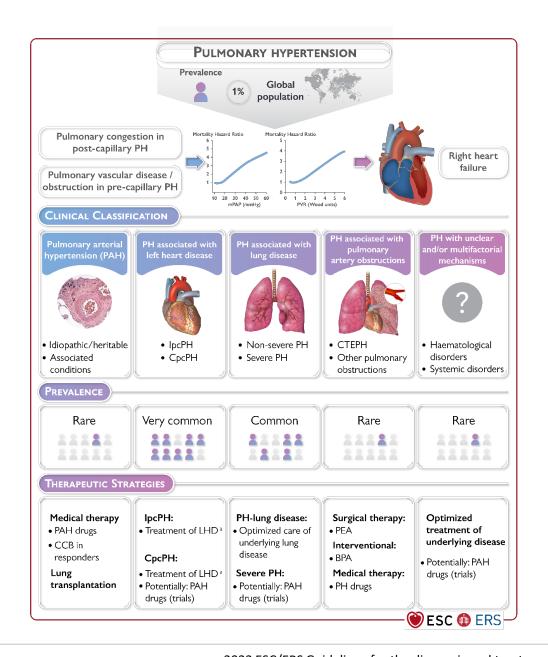

#### **GROUP 4 PH associated with pulmonary artery obstructions**

- 4.1 Chronic thrombo-embolic PH
- 4.2 Other pulmonary artery obstructions

#### **GROUP 5 PH with unclear and/or multi-factorial mechanisms**

- 5.1 Haematological disorders
- 5.2 Systemic disorders
- 5.3 Metabolic disorders
- 5.4 Chronic renal failure with or without haemodialysis
- 5.5 Pulmonary tumour thrombotic microangiopathy
- 5.6 Fibrosing mediastinitis

#### **Central illustration**

## Symptoms in patients with pulmonary hypertension

- Dyspnoea on exertion (WHO-FC)
- Fatigue and rapid exhaustion
- Dyspnoea when bending forward (bendopnoea)
- Palpitations
- Haemoptysis
- Exercise-induced abdominal distension and nausea
- Weight gain due to fluid retention
- Syncope (during or shortly after physical exertion)

#### Rare symptoms due to pulmonary artery dilation<sup>a</sup>

- Exertional chest pain: dynamic compression of the left main coronary artery
- Hoarseness (dysphonia): compression of the left laryngeal recurrent nerve (cardiovocal or Ortner's syndrome)
- Shortness of breath, wheezing, cough, lower respiratory tract infection, atelectasis:
   compression of the bronchi

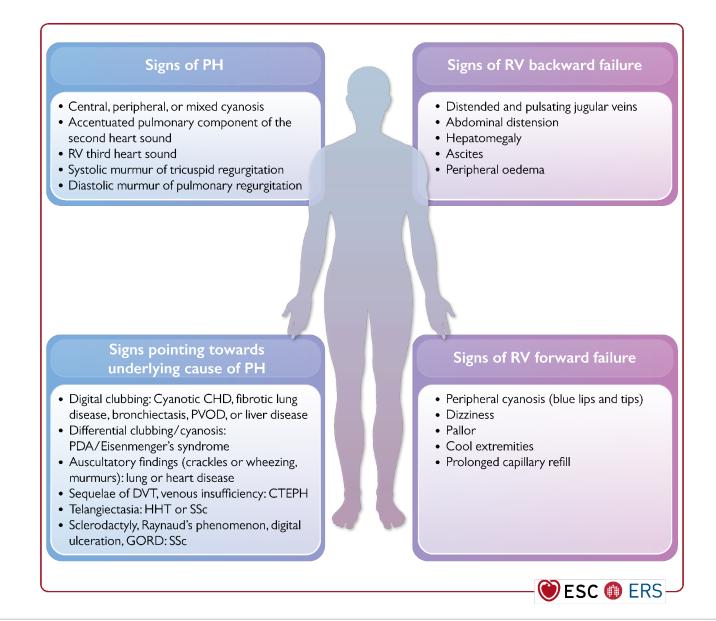

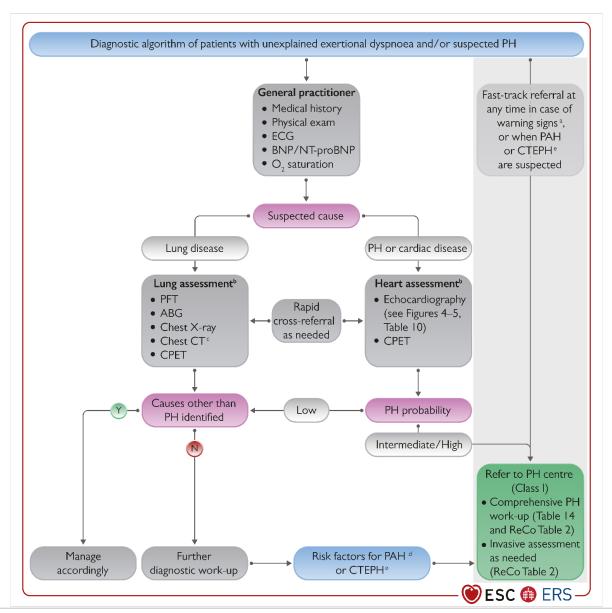

©ESC/ERS

Clinical signs in patients with pulmonary hypertension
