

• increase mortality

## Diagnosis

- 3-5 minute rest
- Arm at level of heart
- Both side measure and take higher
- elderly 1st time <sup>supine sitting erect</sup>
- no caffeine / stimulant 1 hour before / no smoking 30 minutes before
- good weather
- cuff size width 40% of upper arm
- must REMOVE cloth
- 2 readings in 2 visits separated 5-10 minutes => must be elevated in all 4 readings
- Technique
  - ↳ cuff on arm + stethoscope on brachial A. (NOT UNDER CLOTH)
  - ↳ blow up until you hear nothing
  - ↳ deflate cuff 3mm Hg / sec. → make note hear of when you start hear any sound because difference btw (1st - sys) must be 10mmHg
  - ↳ 1st sound isn't systolic. Systolic is when you hear the sound consistently
  - ↳ continue to deflate until you hear no voices => diastolic BP

or else if more, pulsus paradoxus

- AMBULATORY BP
  - ↳ measures BP throughout Day
  - ↳ Used when BP picture in clinic doesn't match clinical picture (patient with end organ damage, but BP normal, or BP is high with no symp.)
- Home BP
  - ↳ must teach
  - ↳ goal is less, because it is expected to be less in home

### White coat HTN vs Masked HTN

- White coat HTN**
  - ↳ HTN in office but not in home
  - ↳ not bad as actual HTN, but must be treated
  - ↳ lifestyle modification
  - ↳ meds
- Masked HTN**
  - ↳ No clinic HTN but is hypertensive in home
  - ↳ hard to catch because is normotensive in clinic
  - ↳ could find unexplained end organ damage

### Primary Workup

- ↳ Eye exam workup
- ↳ basic testing

### Diagnosis of Hypertension:

#### Primary Work up

End organ damage in arterial hypertension	
<b>Vasculopathy</b> <ul style="list-style-type: none"> <li>• Endothelial dysfunction</li> <li>• Remodeling</li> <li>• Generalized atherosclerosis</li> <li>• Arteriosclerotic stenosis</li> <li>• Aortic aneurysm</li> </ul>	<b>Cerebrovascular damage</b> <ul style="list-style-type: none"> <li>• Acute hypertensive encephalopathy</li> <li>• Stroke</li> <li>• Intracerebral hemorrhage</li> <li>• Lacunar infarction</li> <li>• Vascular dementia</li> <li>• Retinopathy</li> </ul>
<b>Heart disease</b> <ul style="list-style-type: none"> <li>• Left ventricular hypertrophy</li> <li>• Atrial fibrillation</li> <li>• Coronary microangiopathy</li> <li>• CHD, myocardial infarction</li> <li>• Heart failure</li> </ul>	<b>Nephropathy</b> <ul style="list-style-type: none"> <li>• Albuminuria</li> <li>• Proteinuria</li> <li>• Chronic renal insufficiency</li> <li>• Renal failure</li> </ul>

### Diagnosis of Hypertension:

#### Primary Work up

BP check is advised routinely every 5 years

Basic Testing	Fasting blood glucose*
	Complete blood count
	Lipid profile
	Serum creatinine with eGFR*
	Serum sodium, potassium, calcium*
	Thyroid-stimulating hormone
Optional Testing	Urinalysis
	Electrocardiogram
	Echocardiogram
	Uric acid
	Urinary albumin to creatinine ratio

\*May be included in a comprehensive metabolic panel

## Diagnosis of Hypertension:

Grade	Classification
Grade I	Mild generalized retinal arteriolar narrowing or sclerosis
Grade II	Define focal narrowing and arteriovenous crossings. Moderate to marked sclerosis of the retinal arterioles. Exaggerated arterial light reflex.
Grade III	Retinal hemorrhages, exudates and cotton wool spots. Sclerosis and spastic lesions of retinal arterioles.
Grade IV	Severe grade III and papilloedema.

=> Retinopathy of #TN

## Secondary HTN

↳ look at slides

- Renovascular
  - ↳ women + young => gives string of beads appearance on renal angio
  - ↳ Attherosclerotic
  - ↳ flash pulmonary edema
  - ↳ bad prognosis
  - ↳ w ACE-I
- Primary Aldosteronism
  - ↳ hypokalemia
  - ↳ to diagnose => plasma aldosterone renin ratio
- OSA
  - ↳ obese, snoring, daytime sleeping
  - ↳ CPAP
- Aortic coarctation
  - ↳ upper hypertensive with lower hypotensive (radio femoral delay on exam)
  - ↳ Associated with bicuspid Aortic valve
  - ↳ rib notching on X Ray
- Alcohol / Amphetamines / Caffeine / Immunosupp => cyclosporin / steroids / SSRI / OCP / decongestant.

## Management

- Normal BP < 120/80 → lifestyle modification
- Gray zone BP 120-129/80 → lifestyle modification
- Stage 1 BP 130-139/80-89 →
  - if CVD risk < 10% → lifestyle modification
  - if CVD risk > 10% → medications
- Stage 2 BP > 140/90 →
  - DM2 / chronic renal insufficiency / PAD => goal < 130/80
- severe HTN BP > 160/100
  - ↳ must work quickly
- Nonpharm. Treatment
  - ↳ weight loss
  - ↳ ↓ salt
  - ↳ Physical Activity
  - ↳ ↓ Alcohol

First choice is  $\left\{ \begin{array}{l} \text{CCB} \\ \text{ACEI} \\ \text{Thiazide} \end{array} \right\}$  Because HF friendly  
Thiazide  $\rightarrow$  African American

Dihydropyridine (Never give nondihydropyridine CCB for patient with HF)

use 2 agent at lower dose than 1 agent at higher doses  
2 agents for  $\left\{ \begin{array}{l} \text{Stage 2 HTN} \\ \text{Average BP } \geq 160/100 \text{ mmHg above their BP target} \end{array} \right.$

- Chlorthalidone is best Thiazide of BP
- ACE + ARBS  $\rightarrow$  careful for kidneys + pregnancy
- Diltiazem + Verapamil (nondihydropyridine)  $\rightarrow$  Avoid in HF
- Amlodipine (dihydropyridine)  $\rightarrow$  v. good
- B blocker  $\rightarrow$  not first line  
 $\rightarrow$  used if secondary cause/diseases  
 $\rightarrow$  don't use Atenolol
- methyl dopa in pregnant
- $\alpha_1$  antagonist  $\rightarrow$  v. hard to use in elderly

## Comorbidities

### HF

- must be aggressive in treatment of HTN
- $< 130/80$

4 ways for HF with reduce Ejection fraction HF rEF

- ① ACEI/ARB + Arni (neprilysin inhibitor)
- ②  $\beta$ B
- ③ mineral corticoid receptor Antagonist (Spironolactone/efepirone)
- ④ DM meds

- Avoid nondihydropyridine CCB  $\left\{ \begin{array}{l} \text{Diltiazem} \\ \text{Verapamil} \end{array} \right.$  in HF

in HFpEF (HF with preserved Ejection Fraction)

$\rightarrow$  must treat HTN

$\rightarrow$  ACEI + ARB

$\rightarrow$   $\beta$  Blocker

## Stable Coronary Disease

- $\beta$  Blocker
- ACEI / ARB
- Dihydropyridine CCB (Amlodipine)
- could use Diuretic
- never use Atenolol

## Acute Coronary Syndrome

- $\beta$  blocker
- nitroglycerine

## CKD

- goal is  $< 130/80$
- IF with Albuminuria  $\rightarrow$  ACE / ARB

# acute Intracerebral Hemorrhage

150-220 mmHg

↳ you might observe because Brain hemorrhage and  $< 140$  mmHg is worse than leaving it BP elevated

$> 220$  mmHg

↓  
must lower

## Ischemic stroke

could give Thrombolysis

if acute and could give **Thrombolysis**

↳ reduce BP less than  $185/110$  mmHg before giving Thrombolytic

DM

• ACE / ARB

AFib

• ACE / ARB

Aortic Disease

• Never  $\beta$  blocker

couldn't give thrombolysis

no thrombolysis therapy

↳ reduce  $< 220/110$  mmHg

don't introduce any HTN medication if BP is  $< 220$  mmHg /  $110$

## Hypertensive Crisis

↳  $> 180 / > 120$

unless you have   
 ICH  
 Head Trauma  
 ↳ must check their own guideline

if organ damage

↳ Hypertensive Emergency

look at associated condition:

① Aortic dissection

↳ reduce BP to  $< 120$  in 1 HOUR  
↳ use Nitroprusside

② pve Eclampsia

↳  $4$  mg  $SO_4$

③ pheochromocytoma crisis

↳ labetalol

if no organ damage

↳ Hypertensive Emergency

↳ adjust drugs and educate + give clinic visit

IF emergency and not these:

① Reduce BP by 25% max over 1 hour

② then 160/100 over 2-6 hours

③ then normal over 24-48h

↳ reduce BP  $< 140$  in 1 hour

Drugs: ① CCB IV

② Nitroprusside

③ Nitroglycerine

HF  
 Acute coronary syndrome  
 Pulm. edema

④ hydralazine

⑤ esmolol ( $\beta$  selective shortacting)

⑥ Fenoldopam (selective dopaminergic)  
↳ in nephritic

• Resistant HTN

↳ 3 Agent ← Diuretics with optimal doses

• Refractory HTN

↳ 4 Agent ← Diuretics with optimal doses

• Pseudoresistant

↳ looks uncontrolled but there is problem with

- wrong BP reading
- no compliant
- suboptimal treatment
- white coat HTN
- No lifestyle modification

Risk factor of Resistant, check slides

**Risk Factors**

PATIENT RELATED	POTENTIALLY REVERSIBLE
<ul style="list-style-type: none"> <li>Higher baseline BP (particularly systolic)</li> <li>Presence of LVH</li> <li>Older age</li> <li>Obesity</li> <li>African-American race</li> <li>Chronic kidney disease</li> <li>Diabetes</li> </ul>	<ul style="list-style-type: none"> <li>Suboptimal therapy</li> <li>Lifestyle and diet</li> <li>Medications</li> <li>Extracellular volume expansion</li> <li>Secondary causes of hypertension</li> <li>OSA</li> </ul>

**Risk Factors**

- Medications
  - Can raise BP or reduce the response to antihypertensive drugs
  - Most commonly implicated agents are:
    - NSAIDs
      - NSAIDs can interfere with the antihypertensive effect of virtually any agent, except calcium channel blockers
    - Sympathomimetics
      - Diet pills
      - Decongestants
      - Amphetamine-like stimulants
    - Cocaine
    - Alcohol
    - Glucocorticoids
      - Estrogen-containing contraceptives
      - Erythropoietin
      - Herbal preparations (ephedra or ma huang)
      - Natural Licorice
      - Calcineurin inhibitors (cyclosporine and tacrolimus)
      - Antidepressants

**Risk Factors**

- Suboptimal therapy
- Lifestyle and diet
  - Obesity
  - High-salt diet
  - Physical inactivity
  - Heavy alcohol intake
- Extracellular volume expansion
  - Renal insufficiency
  - Sodium retention due to therapy with vasodilators
  - Ingestion of a high-salt diet (which can be assessed by measuring sodium excretion in a 24-hour urine collection)

management

- steps
- check if not pseudoresistant
  - substitute diuretic to thiazide - LIKE diuretic (chlorthalidone)
  - add mineralocorticoid receptor blocker (spironolactone)
  - add beta blocker (carvedilol / labetalol)
  - add clonidine
  - re-evaluate for secondary
  - add hydralazine ± isosorbide
  - minoxidil
  - renal Denervation
