

# Principles of fractures

---

Jihad Ajlouni

# Introduction:

Infection  
treatment?  
✓ Supportive  
✓ antimicrobials  
✓ surgery

- ③ Trauma remains the leading cause of death in the first four decades of life (1-44 years).
- ② Surpassed only by cancer & atherosclerosis as the major cause of death in all age groups.

Trauma → RTA  
→ Falling down

Saudi Arabia  
↳ abt of trauma (RTAs)

# Introduction:

---

- 60 million injuries / year in the U.S.
- 30 million (50%) require medical care.
- 3.6 million (12% of 30 million) require hospitalisation.
- 9 million are disabling ( at least 24 hr off work).
- 300.000 permanently, 8.7 million temporarily.
- Trauma-related costs 400 billion \$/year.

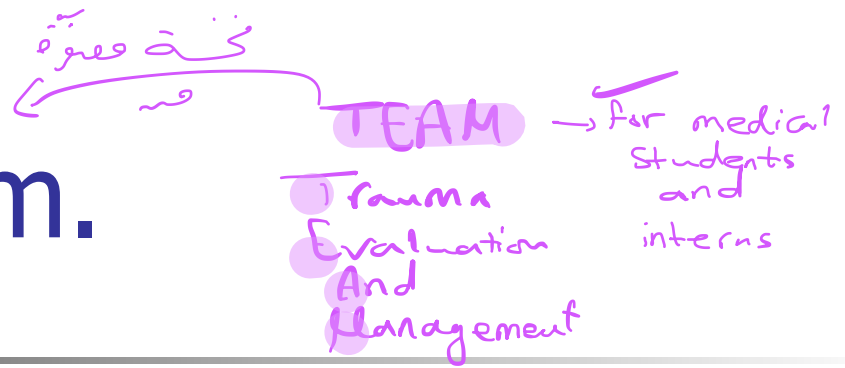

# No patient ever died of a broken bone

---

- While the expert and expeditious care of orthopaedic trauma directly bears upon the patients morbidity and eventual functional recovery, the question of patients survival must be addressed prior to any orthopaedic consideration.

- Life, limb, wound, fracture.

# ATLS program.

- Treat the greatest threat to life.
- The lack of definitive diagnosis should never impede the application of an indicated treatment.
- Detailed history was not essential to begin the evaluation and treatment.
- ABCDE.

Trimodal death 3 peaks of death in trauma

- ① Immediate (Seconds, mins) → prevention
- ② hrs (ABCDE) → ATLS
- ③ weeks → -ve nitrogen balance, malnourishment, infections → they need specialized trauma centers

# Description of fractures

- wound → discontinuity of skin
- ulcer → discontinuity of epithelium
- fistula → abnormal opening b/w 2 epithelized surfaces
- sinus → blind-ended
- laceration → discontinuity of organ or capsule
- contusion → bruise

- Fracture: discontinuity of bone.
- Fractures can be categorized in several ways, <sup>①</sup>pathologic or traumatic, <sup>②</sup>stress, <sup>③</sup>location in bone, <sup>④</sup>mechanism of injury, <sup>⑤</sup>status of soft tissue...etc.

§ Simple, compound  
§ displaced or not  
§ open, closed

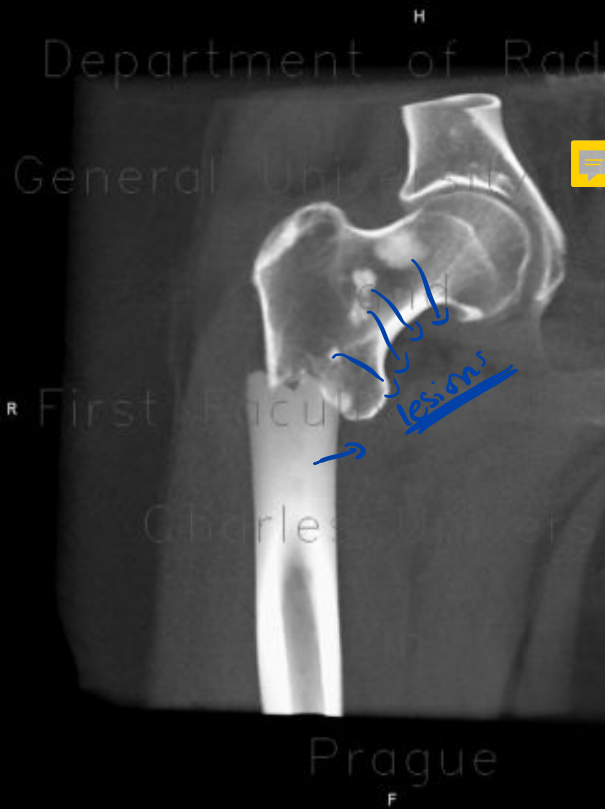

§ adult, pedis  
§ complete, incomplete  
§ shape

# Pathologic fractures.

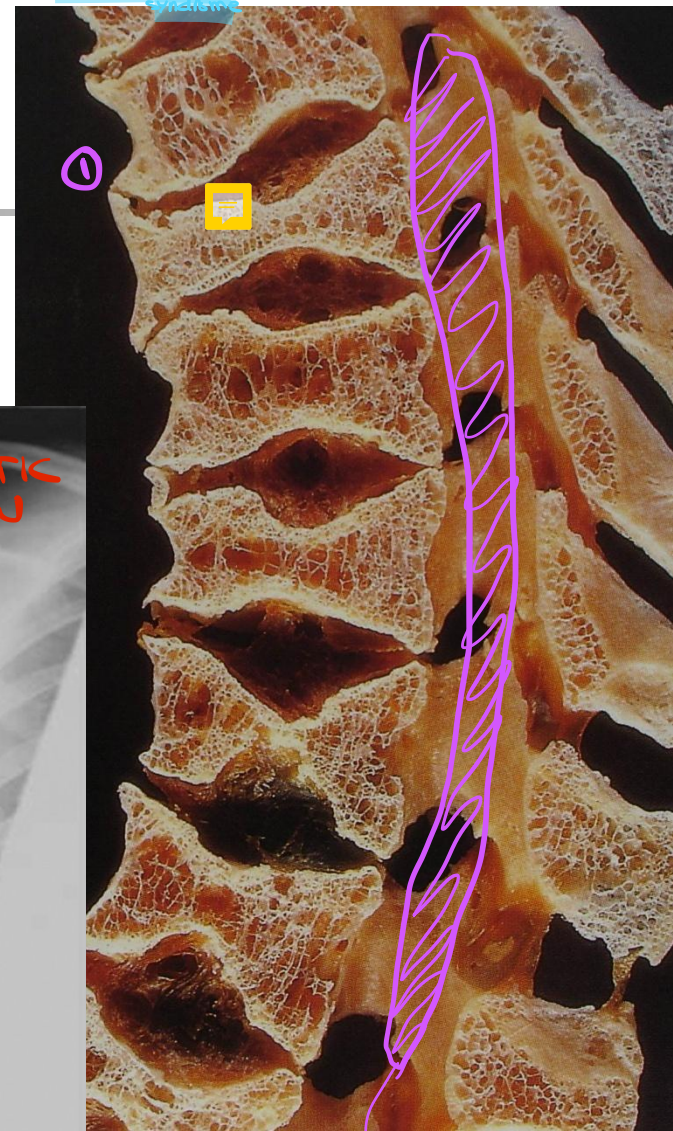

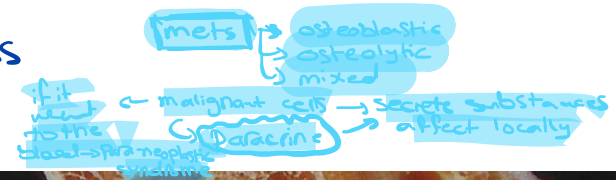

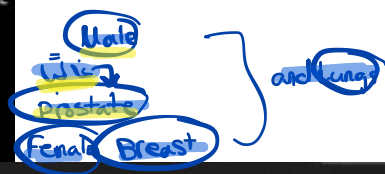

weakened bone

- A bone is broken through an area weakened by pre existing disease, by a degree of stress that would have left a normal bone intact.
- Dx by Hx.
- Underlying cause.
- Osteoporosis, metabolic, infection, malignancy...etc.
- ✓ Insufficiency fracture. (Pentecost et al, 1964)

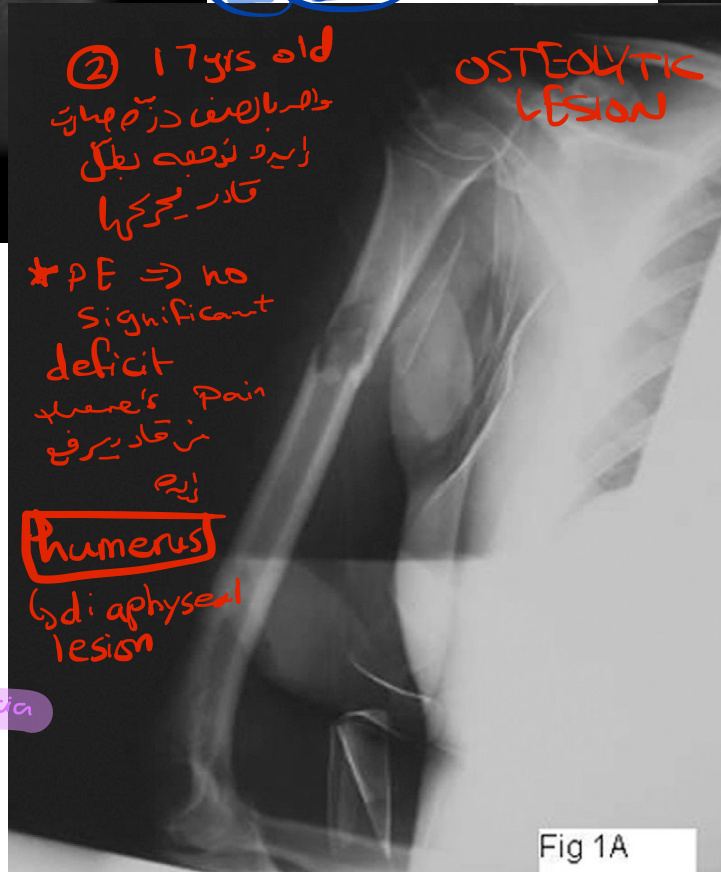

③ → multiple hyperdense lesions (mets)

80yrs old  
known case of CA prostate  
کن متاستازهای موق در

① 70yrs old  
Kyphosis  
chronic back pain  
constipation  
hyperpara

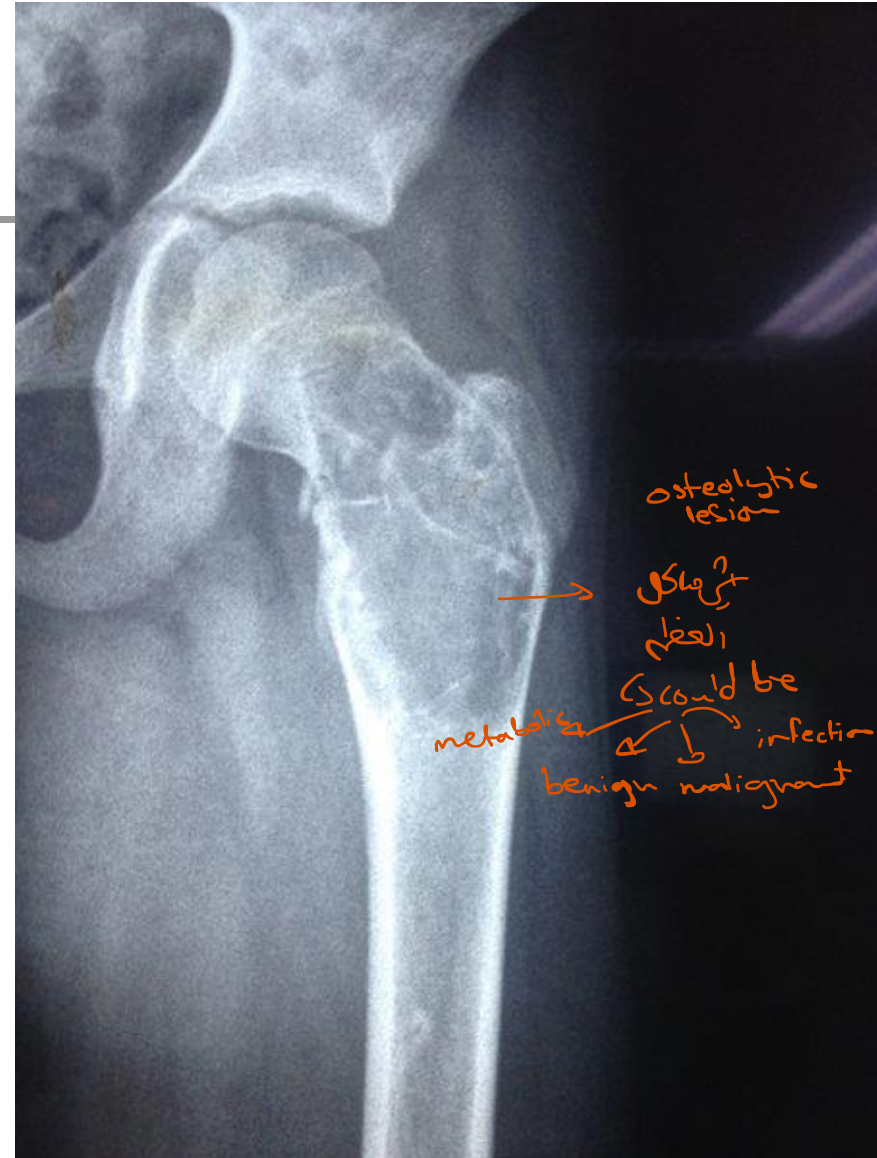

→ osteoporosis or osteomalacia  
systemic disease  
multiple vertebral fractures due to weakened bone

Fig 1A

متى هناك العظم  
 ↳ most likely malignant

# Stress fractures

No major trauma, but repetitive minor traumas

Protective Pain

Insufficient fracture

normal load but bcz they have ↓ repair  
stress, عجز في الإصلاح

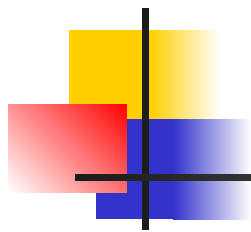

injury → repair  
balance

injury >>> repair

steroids  
↓ DPA  
↓ Malnourished  
↓ ability to repair

- Bone reacts to repeated loading. on occasion, it becomes fatigued and a crack develops, which may lead to a complete fracture.
- Military installations, ballet dancers, athletes.
- Backer et al, JBJS, 54A 1972, stress fractures occur only after muscle fatigue, and the absence of functioning muscles allows abnormal stress concentration.

E.P.

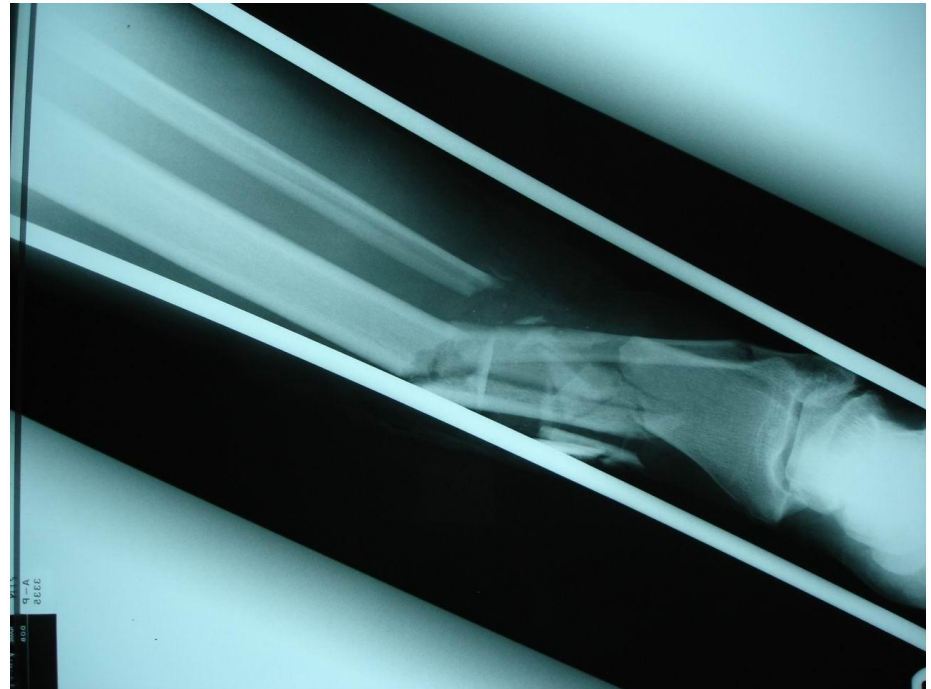

# Mechanical Loading of Bone

# Shape of fracture

- Simple.

- Multi-fragment. (comminuted).

# Shape of fracture

دiameter  
د fracture  
د diameter  
د bone

■ **Transverse.** → diameter of fracture = diameter of bone

■ **Oblique.** → دیکه بیضی

↳ in 1 plane

■ **Spiral.** → in more than one plane

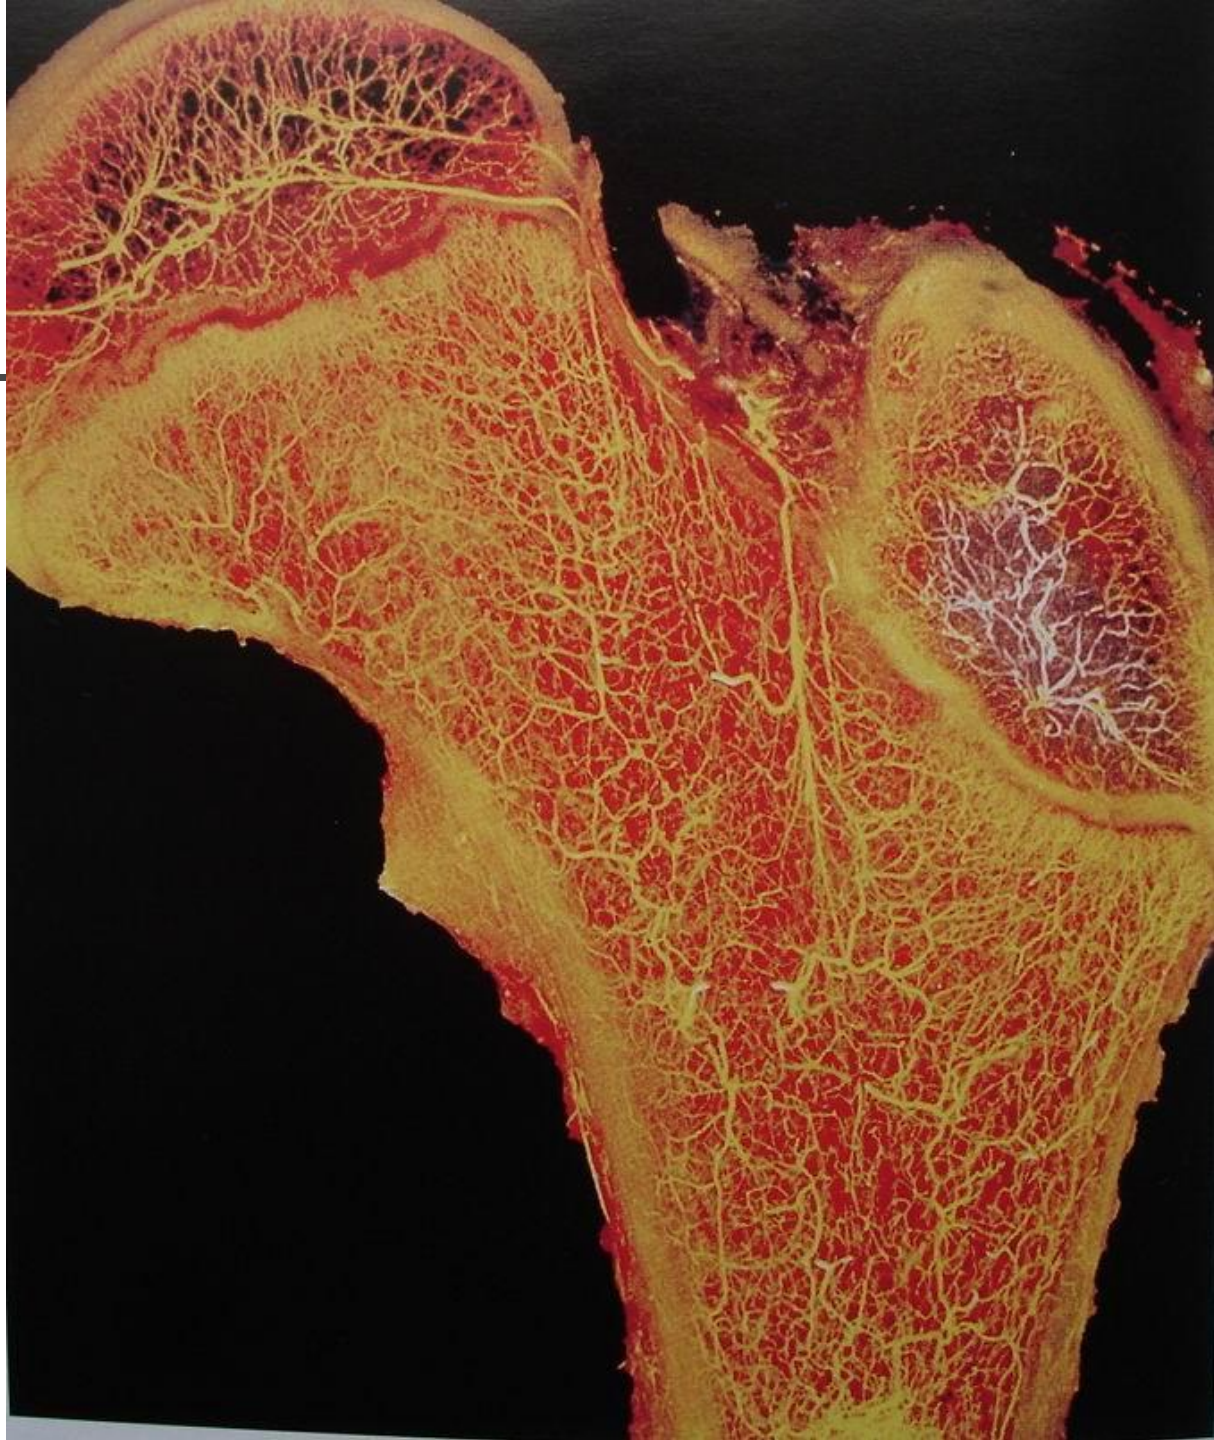

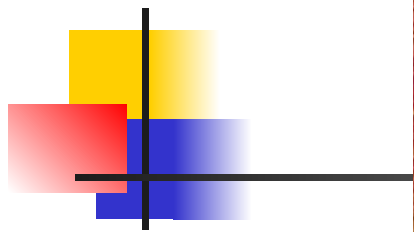

# Classification by anatomical location.

---

- Epiphysis.
- Metaphysis.
- Diaphysis.
- Capsule.
- Articular surface.
- Growth plate.

---

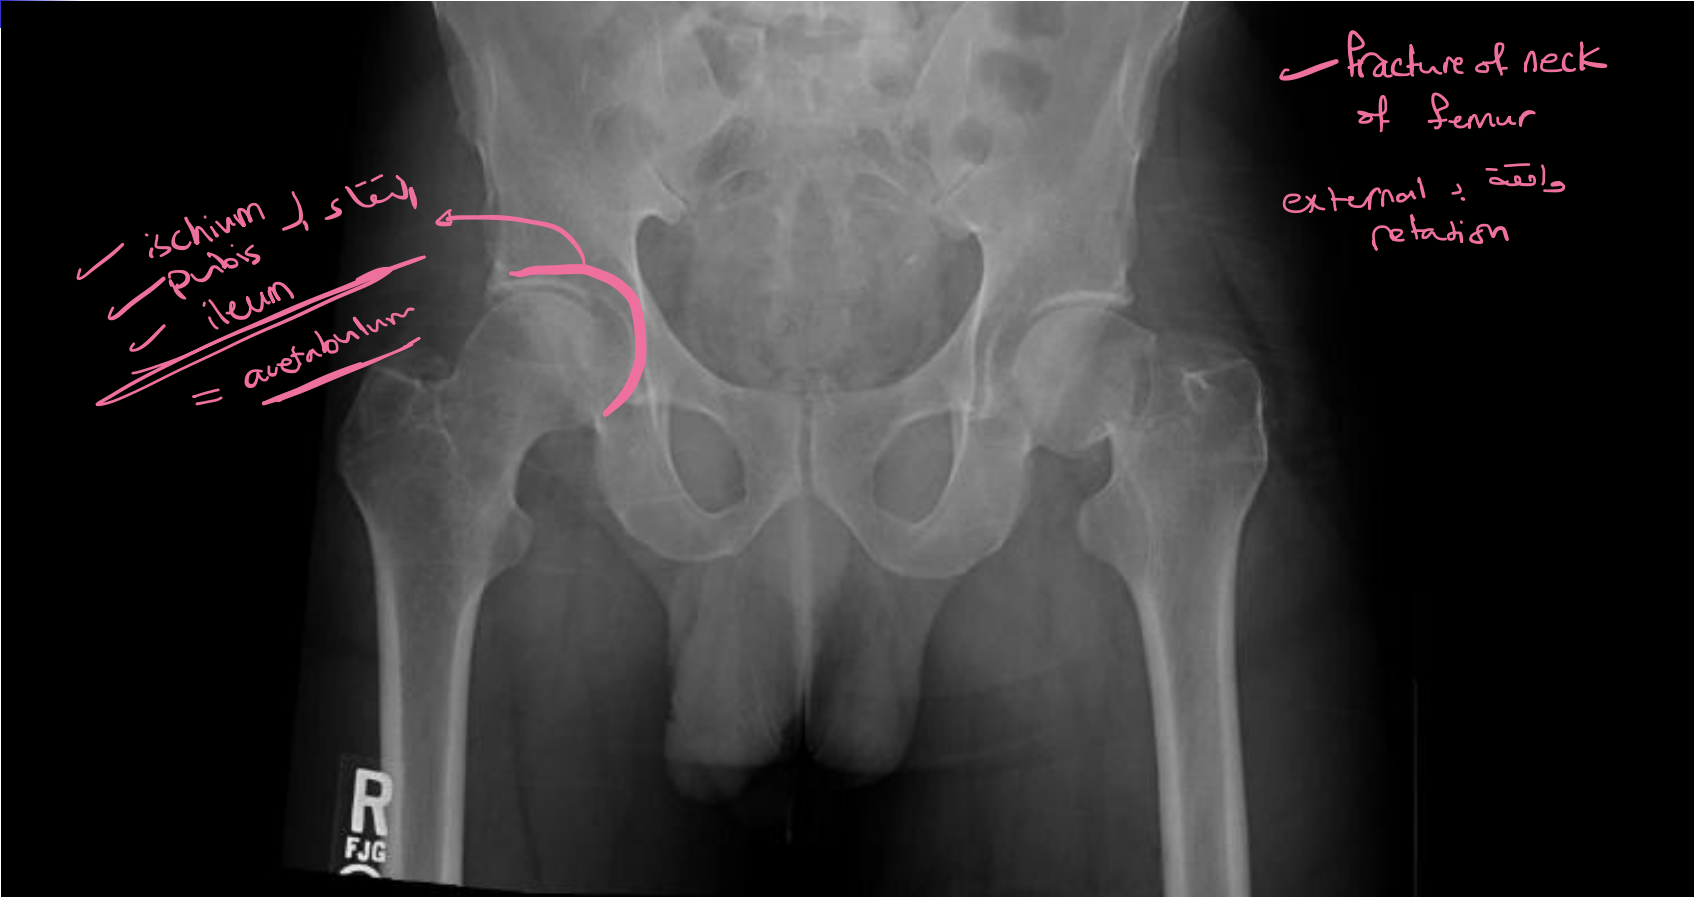

■ Epiphysis:

difficult reduction.

intracapsular.

intraarticular.

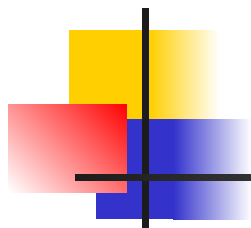

**joint stiffness.**

✓ ischium  
✓ pubis  
✓ ilium  
= acetabulum

✓ Fracture of neck  
of femur  
external & medial  
rotation

✓ Deformity → عيب في الشكل  
✓ Shortening → قصر

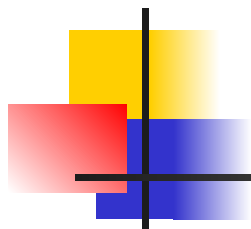

○ dislocation → مفصل  
○ displacement → كسر

Extraarticular

Intraarticular

- Joint stiffness.
- 2<sup>ry</sup> Osteoarthritis.

# metaphysis

Malunion  
nonunion  
Delayed union

Good blood supply.

Malunion rather than nonunion.

bcz alot of  
① muscles

② and the bone is weak

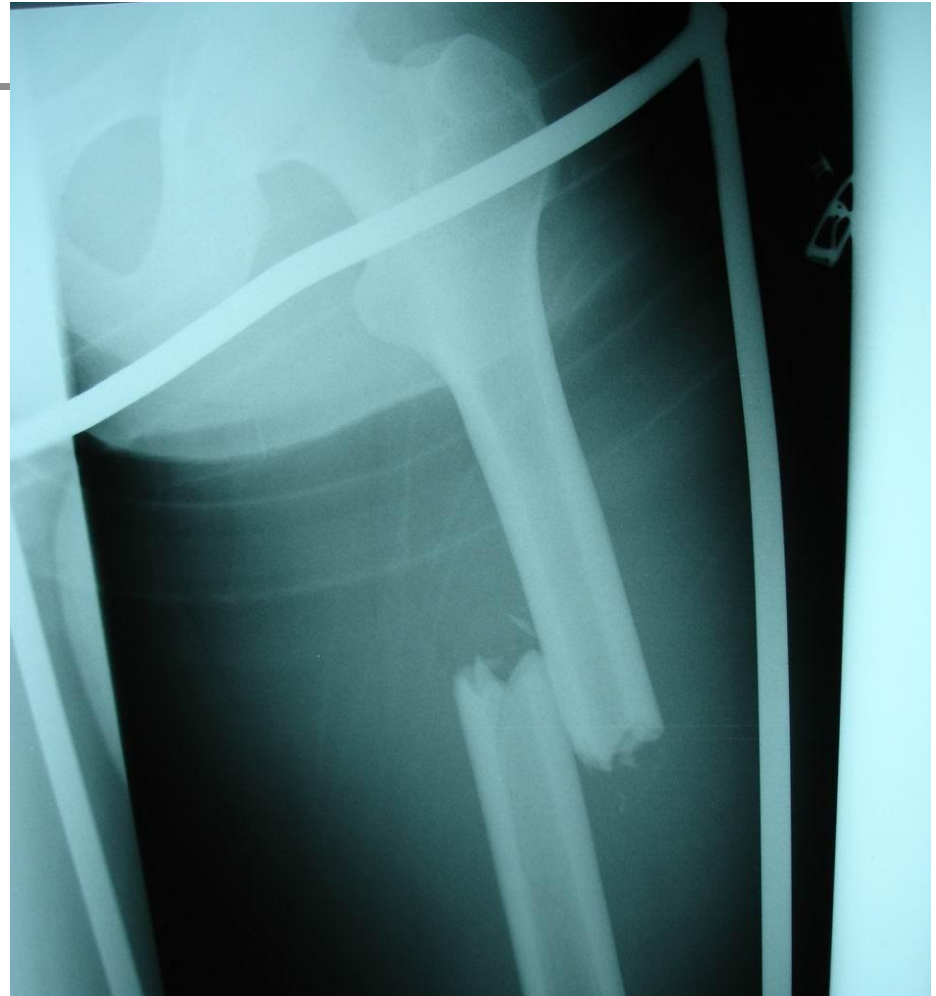

# diaphysis

---

Unstable

Need fixation.

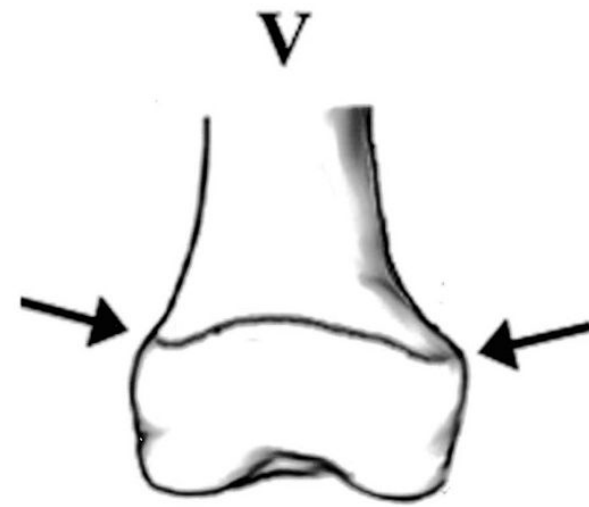

# Growth plate injury

complete → shortening  
→ complete → deformity

# The condition of the surrounding soft tissue

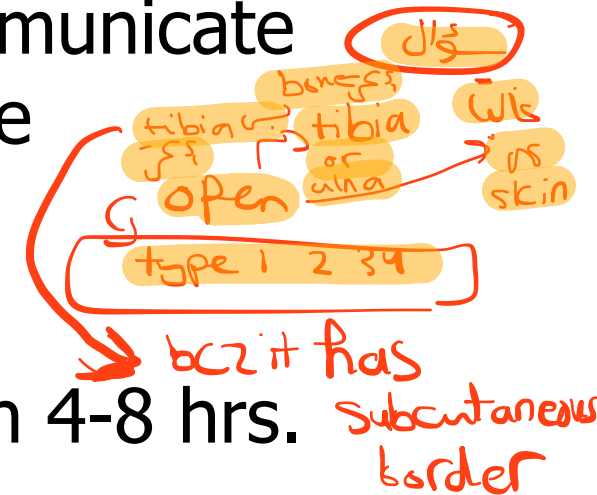

liable for infection → \*open → fracture communicating with the environment  
\*closed

عالب = skin

- Open fractures by definition communicate through a traumatic wound to the surrounding environment.

- Tetanus prophylaxis.
- Irrigation and debridement within 4-8 hrs.
- Antibiotic prophylaxis:

first generation cephalosporine,  
+ aminoglycoside (high energy),  
+ penicillin (barnyard).

\* Pelvic Fractures  
rectum, or vagina or spinal? fractures

fracture in  
humerus ①  
→ (metaphysis)

malunion

② open (infection)

③ growth plate  
plate (deformity)

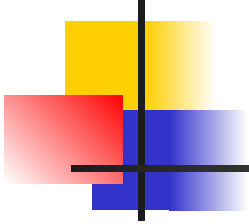

Diaphysis → unstable

metaphysis → malunion  
intra-articular → 2ry  
osteoarthritis

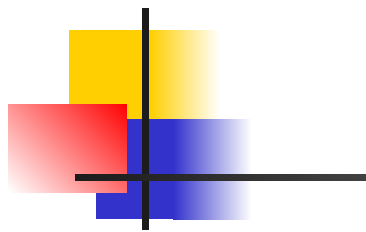

open  
infection

# The condition of the surrounding soft tissue

- Gustilo and Anderson(1976, 1984):
  - I : clean wound < 1 cm.
  - II : >1 cm without extensive soft tissue damage, skin flaps, or avulsion.
  - IIIA : extensive soft tissue damage or flaps but maintains adequate coverage.  
**high energy.**
  - IIIB : periosteal stripping and bony exposure.
  - IIIC : vascular injury.

- 
- how to treat open fractures in emergency?
- 

**ATLS.** (Life, limb, wound, fracture)

**Analgesia.**

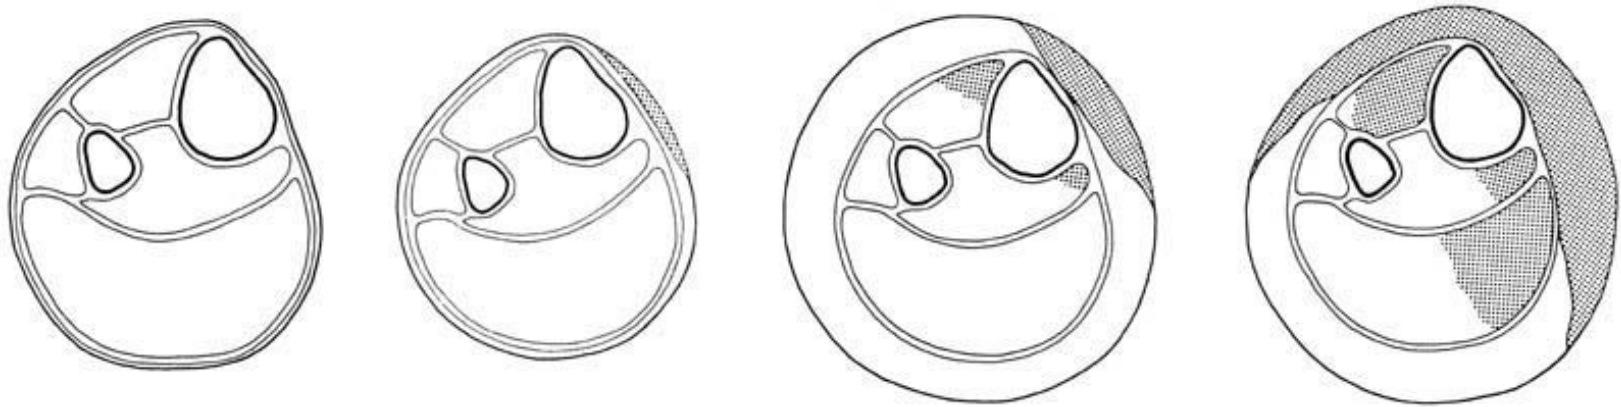

**Anti tetanus toxoid.**

**Antibiotics.** → the most important factor to prevent infection

**Adequate Irrigation.**

↳ Dilution of bacteria

# Soft tissue injuries in closed #

- Tscheme & Gotzen 1984.
- 0 : little or no soft tissue injury.
- 1 : superficial.
- 2 : deep abrasion.
- 3 : Crushing.

# Description of the deformity:

---

- Distal segment.
  - 3 planes: axial, Sagittal, coronal.
  - Displacement and angulation.
  - 2 views, 2 joints, 2 limbs, 2 positions, 2 occasions.
  - Initial X-ray: personality of the fracture.
- 

# Clinical features of fractures:

---

- Pain and tenderness.
- Loss of function.
- Deformity.
- Attitude.
- Abnormal mobility and crepetus.
- Neurovascular injury.
- X-ray findings.

# Emergency management of #

---

- London P.S (injury,3:225-238 1972):  
one of the most highly touted and least frequently obeyed maxims in emergency care is “splint them where they lie”.
- Crews often said that with a journey that was usually short they did not think that the time spent on applying splints was justifiable.

# Emergency management of #

---

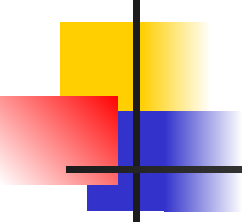

- Prevent further soft tissue damage.
- Pain relief.
- Decrease the incidence of clinical fat emboli and shock.
- Facilitates patient transport and radiographic studies.
- 3 As: analgesia, antibiotics, antitetanus toxoid.

# Treatment

---

There is danger inherent in the mechanical efficiency of our modern methods, danger lest the craftsman forget that **union cannot be imposed** but may have to be **encouraged**. Where bone is a plant, with its roots in soft tissues, and when its vascular connections are damaged, it often requires, not the technique of a cabinet maker, but the patient care and understanding of a **gardener**.

- 
- 
- Personality of fracture. → Site (metaphysis, ----)
  - Personality of soft tissue. → open  
→ closed  
soft tissue takes priority over bones
  - Personality of the patient. → DM, age, right or left handed
  - Personality of the doctor and hospital.

# Treatment

- 1. **Reduction:** any dislocation is an emergency.

✓ closed or open.

✓ ~~anatomical~~ anatomical or functional

2

- 2. **Immobilization:** *absolute stability* *relative stability*

traction, cast, external fixation, internal fixation.

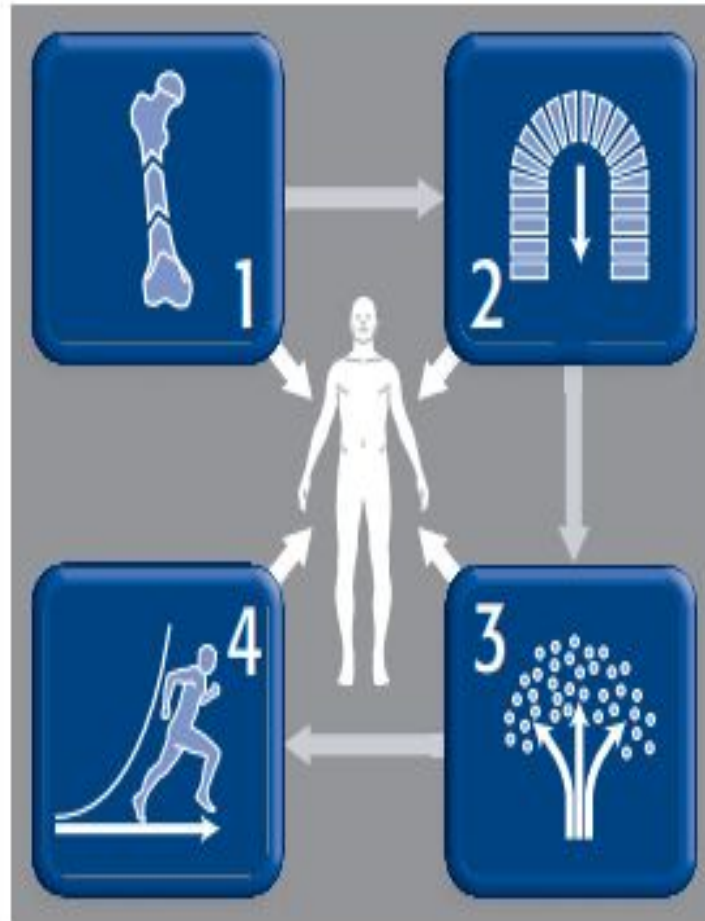

3

- 3. **Rehabilitation.**

# The AO principles of fracture management

Fracture reduction and fixation to restore anatomical relationships.

Early and safe mobilization and rehabilitation of the injured part and the patient as a whole.

Fracture fixation providing absolute or relative stability, as required by the "personality" of the fracture, the patient, and the injury.

Preservation of the blood supply to soft tissues and bone by gentle reduction techniques and careful handling.

# Internal fixation:

---

- Apley A.G, Rowly JBJS 74B 1992  
(editorial) Fixation is Fun.

they thought that open reductions were done because orthopaedists enjoyed doing them.

they believed that surgeons who treat fractures should be equally adept in both methods.

# Healing calendar.

② face stitches  
3-5 days

③ UL chest

④ lower limb

⑤ joint

# Complications

---

- Bone healing abnormalities:
  - Delayed union.**
  - Nonunion.**
  - Malunion.**
  - **AVN.**

# Complications

---

- Infection.
- Soft tissue injuries:  
arterial, nerve injuries, compartment syndrome.
- Pulmonary complications: PE, FE, ARDS.
- Bleeding disorders.
- Others: CRPS(RSD), MO, OA.

# summery

---

- A fracture is a break in the structural continuity of bone.
- "a **soft tissue injury complicated** by a break in the bone."
- Life, Limb, wound, fracture.
- Traumatic or pathological.

# summery

---

- Simple or comminuted.
- Open ----- infection.
- Growth plate -----deformity.
- Epiphysis-----joint stiffness.
- Intra articular -----osteoarthrititis.
- Metaphysis-----malunion.
- Diaphysis-----unstable.

# summery

---

- Reduction
- Immobilization.
- Rehabilitation.
