

Osteoporosis

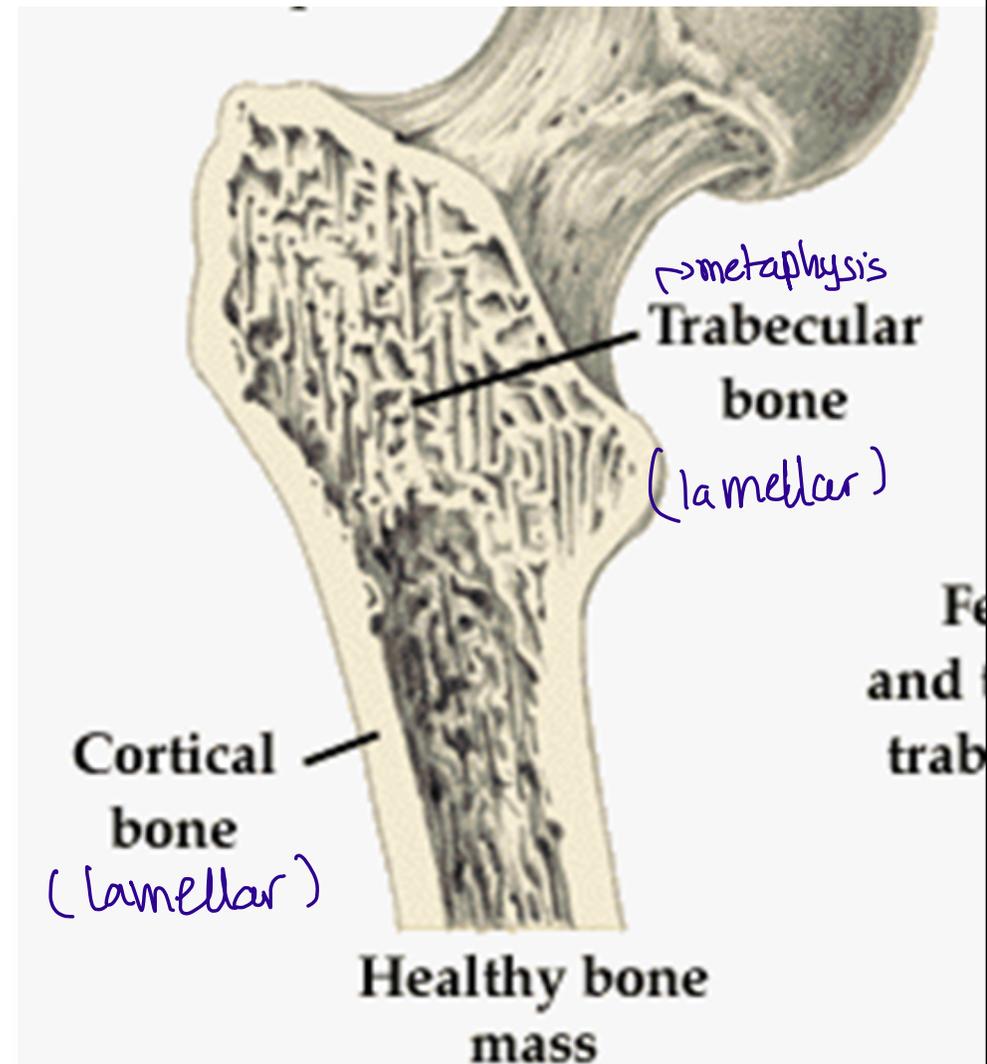

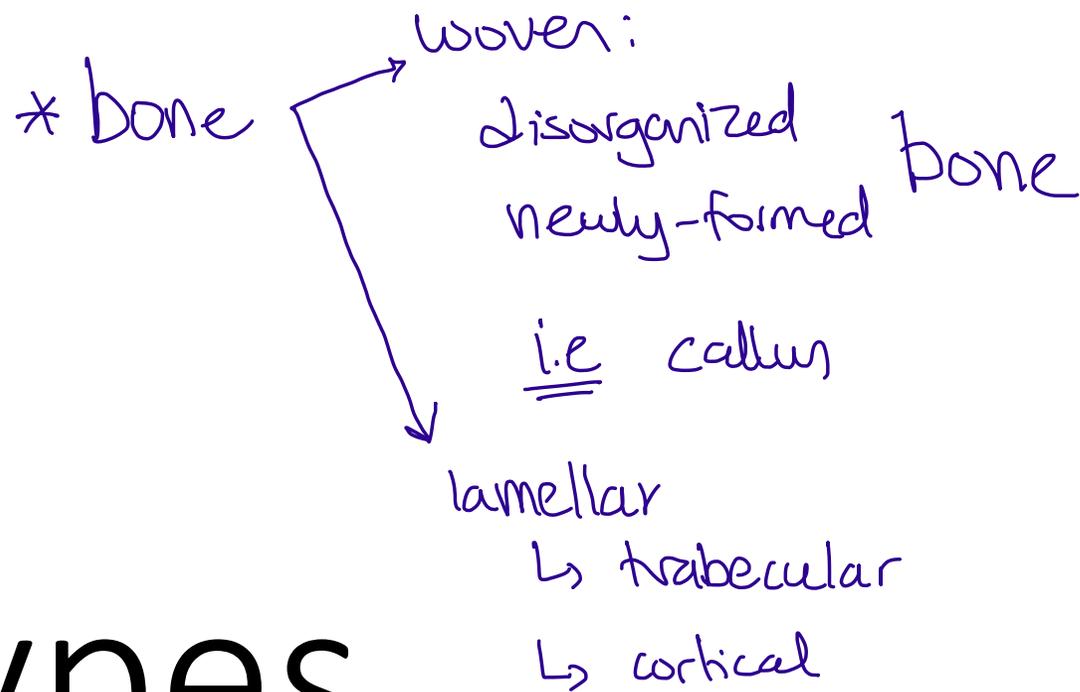

Dr. Mohammad Hamdan

Why important

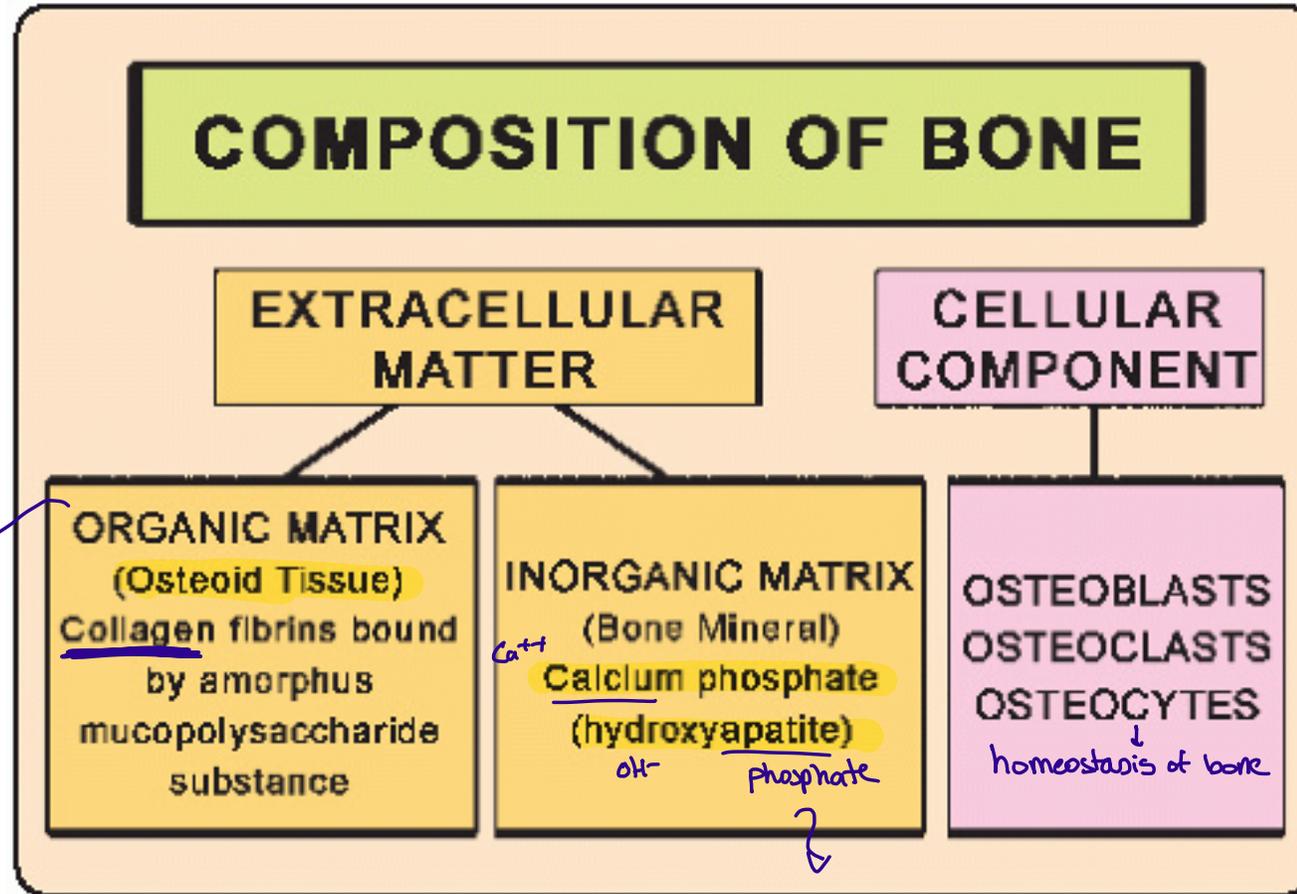

- 10 million Americans and 200 million people worldwide have osteoporosis
- 1.5 million osteoporotic fractures occur each year
- Hip Fx mortality 20%
- Vertebra Fx mortality 15%

↑ burden
↑ challenge

Types

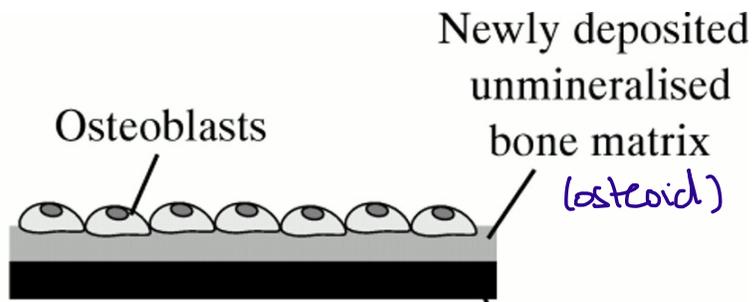

force
Compression side (inorganic)
Tension side (organic)
femur

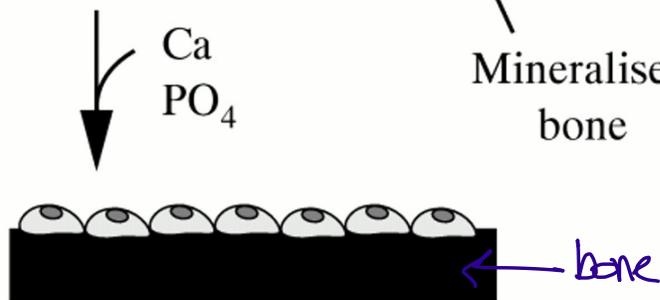

tension resistant

Compression resistant

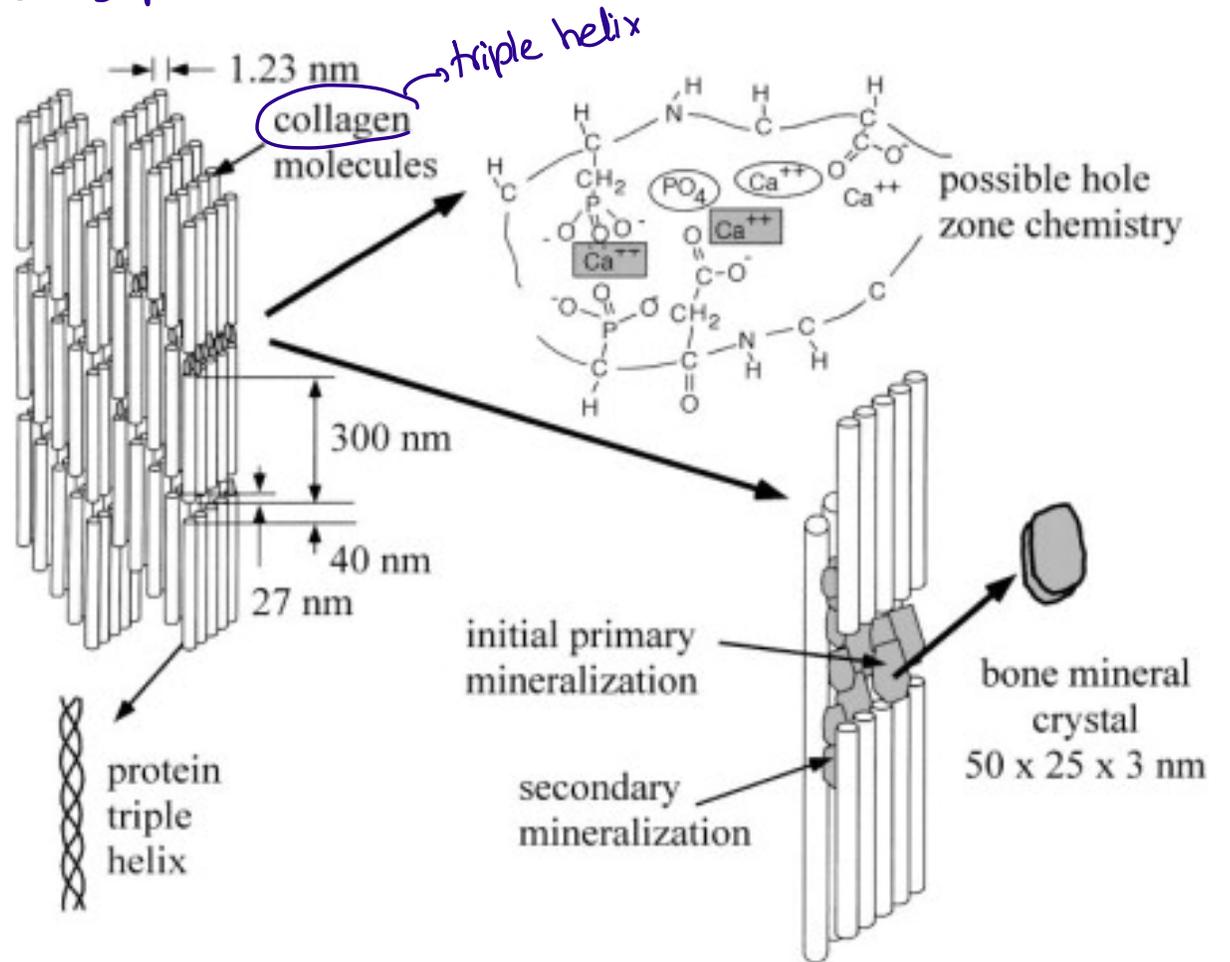

Step 1:
Deposition of
osteoid

Step 2:
Mineralisation

holes & fibres

* Mineralization *

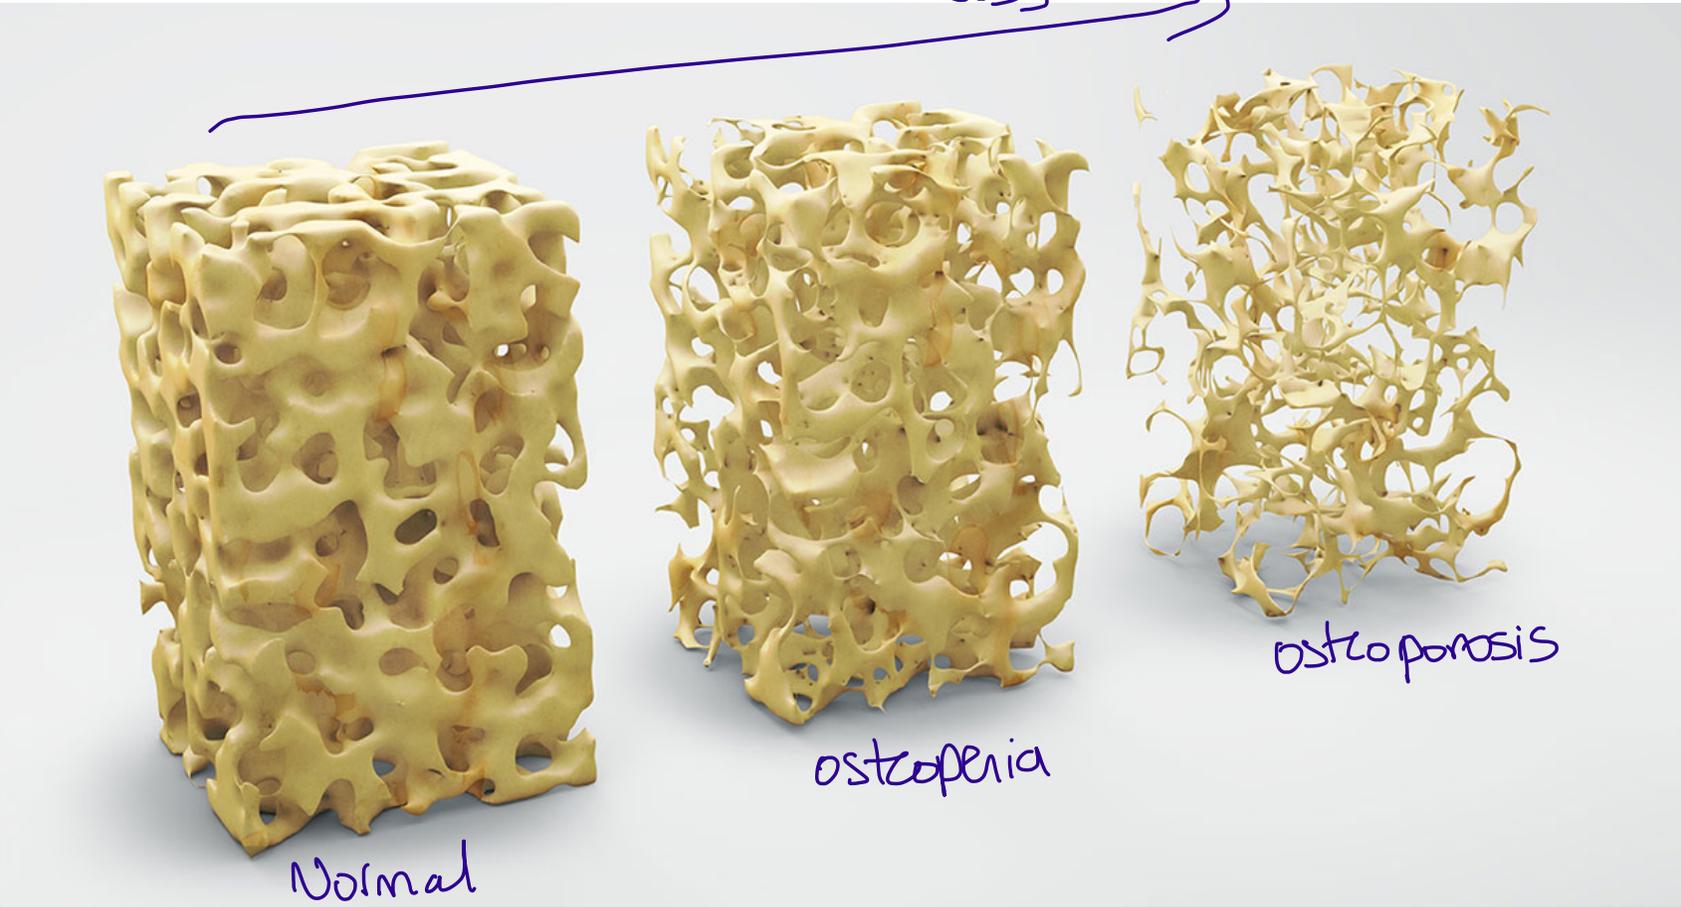

Osteoporosis is...

“...a systemic skeletal disease characterized by **low bone mass** and **microarchitectural deterioration** with a consequent increase in bone fragility with susceptibility to fracture...”

Definition from WHO

Trabecular bone

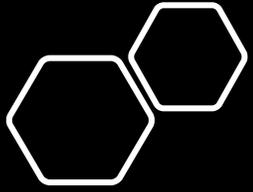

↓ bone mass →

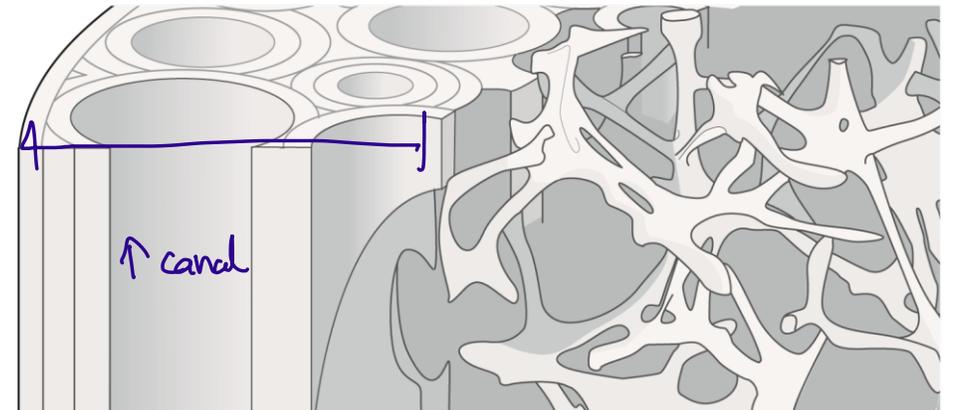

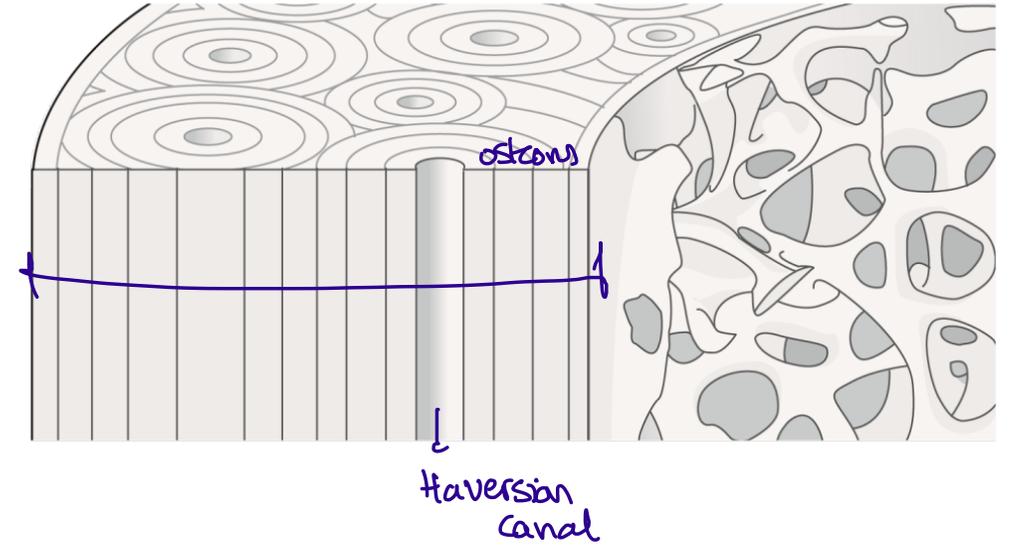

Normal

osteopenia

osteoporosis

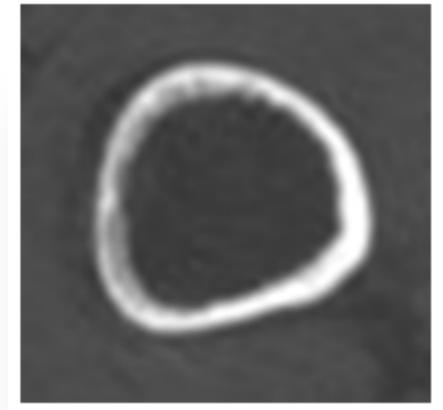

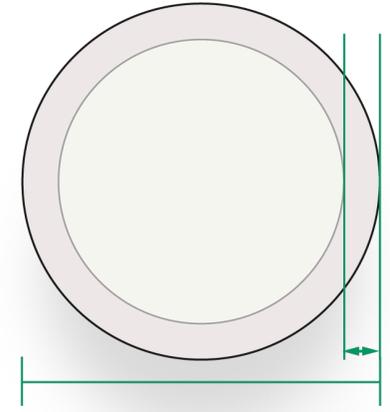

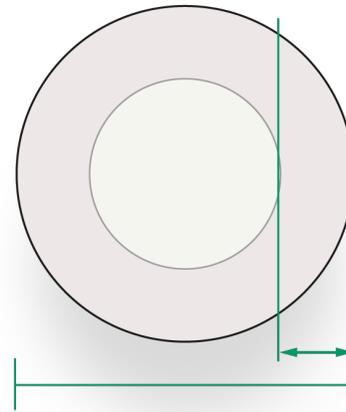

cortical bone

↓ thickness

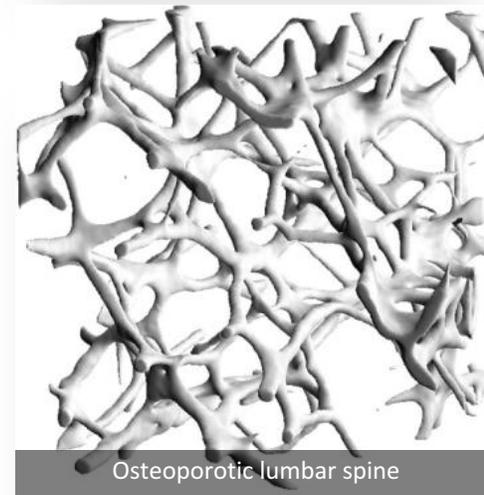

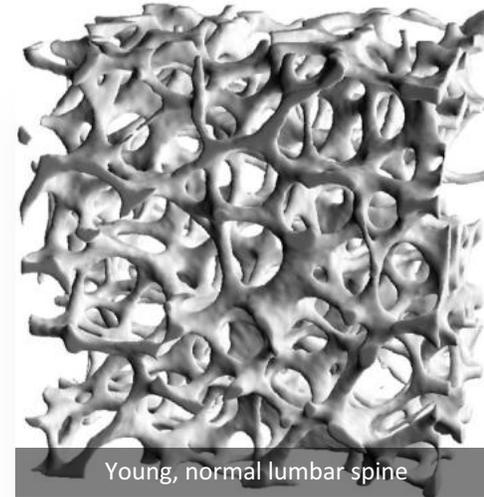

Cortical bone

Cancellous bone

Less and thinner trabeculae with fewer, often broken interconnections

Types

Primary Osteoporosis

Primary: Is the more common form and is due to the typical age-related loss of bone from skeleton.

Type 1 (Postmenopausal Osteoporosis)

- Due to decrease in estrogen or testosterone deficiency MC

Type 2 (Senile Osteoporosis)

- Inability to produce adequate vitamin D3
- Decrease in bone formation

Secondary Osteoporosis

Secondary: Results from the presence of other diseases or conditions that predispose to bone loss.

- Medications → anticoagulants
anticonvulsants
furosemide
- Hyperparathyroidism
- Excess Alcohol
- Smoking

* estrogen normally

↑ osteoblast

↓ osteoclast

→ first 6 years after menopause

Location of fractures

- * osteoporosis alone : usually asymptomatic
- * fractured osteoporosis : painful

- vertebral body > hip > wrist fractures
(axial)

Risk factors

Thin, smoker and alcoholic old Caucasian white female with freckles and fair hair known to have RA on steroid

F more than M

Medications

- Steroid
- Phenytoin
- LMWH
- Omeprazole

Diseases

- Malabsorption syndromes
- Hyperthyroidism
- DM1
- Hypogonadism
- Cancers

Risk Factors

Symptoms and Signs

Patients with osteoporosis are asymptomatic unless a fracture has occurred

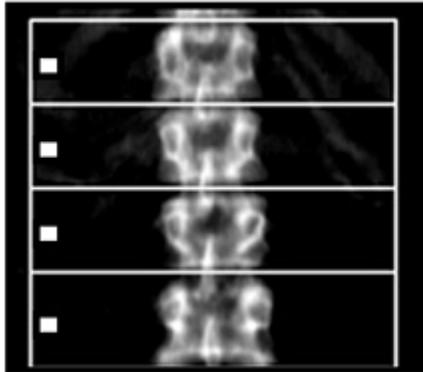

Signs follow the same rule

Diagnosis

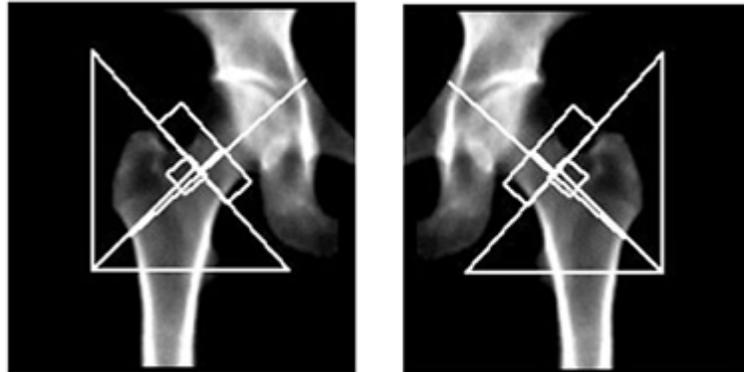

* Peak of bone density
⇒ at the age of 25.

- Dexa Scan (Dual Energy Xray Absorptiometry)

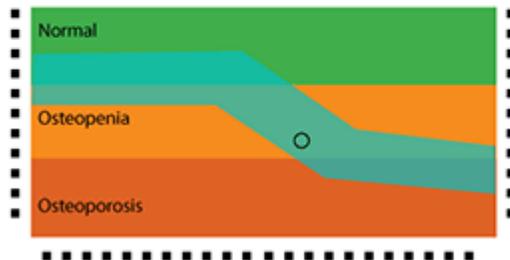

vertebrae

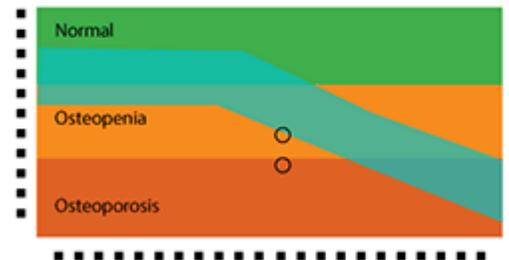

hip

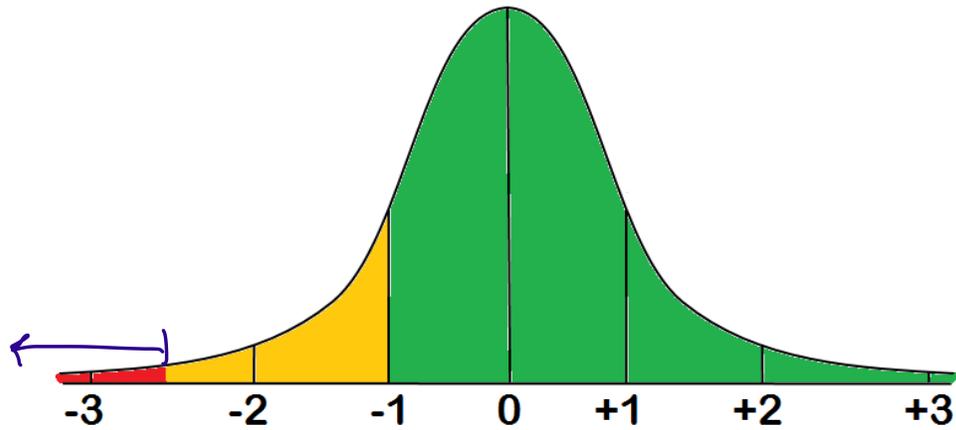

ReferenceL Spine L1-L4

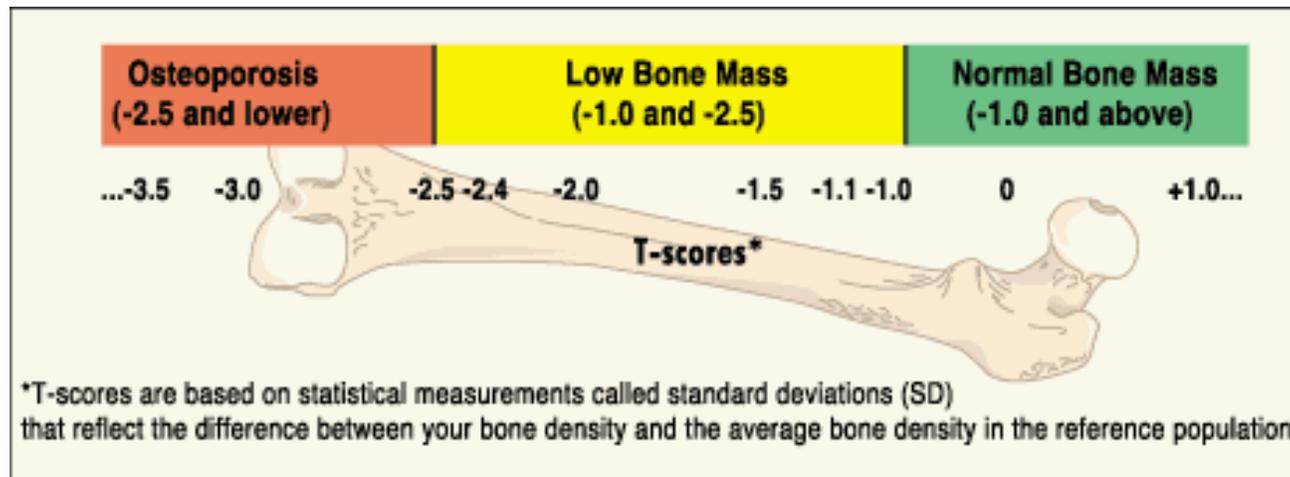

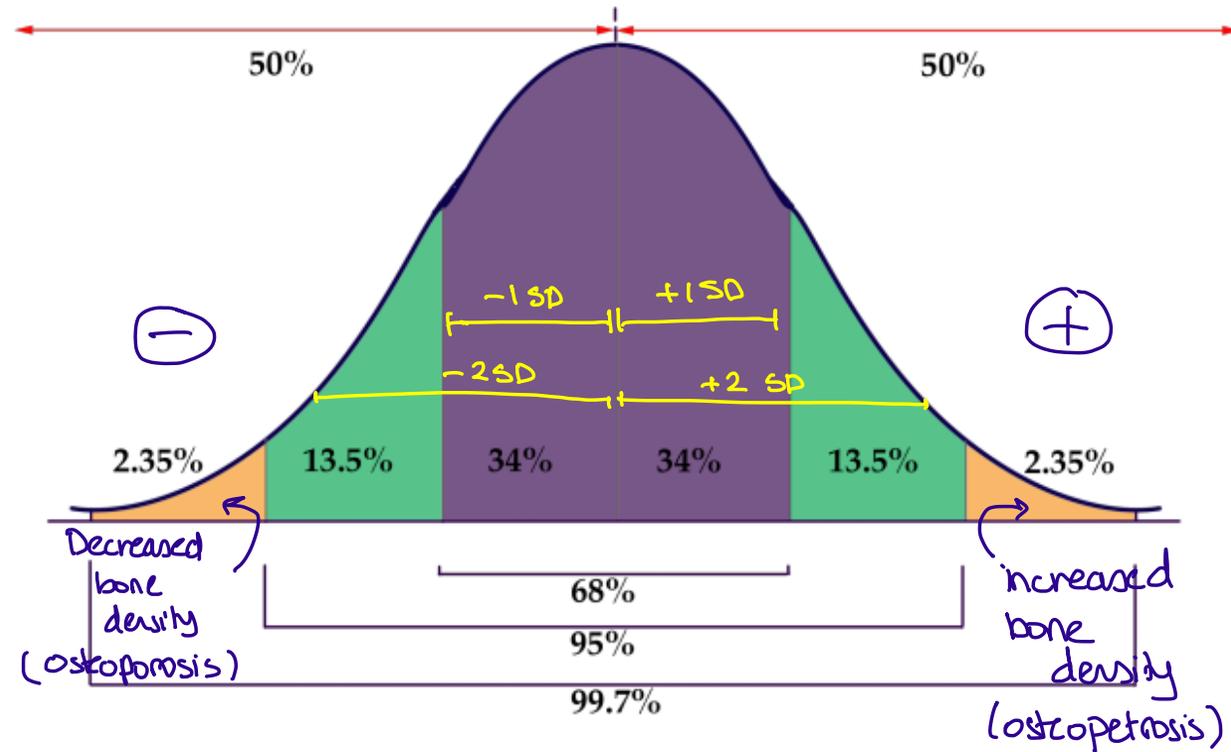

ReferenceL Dual Femur Total

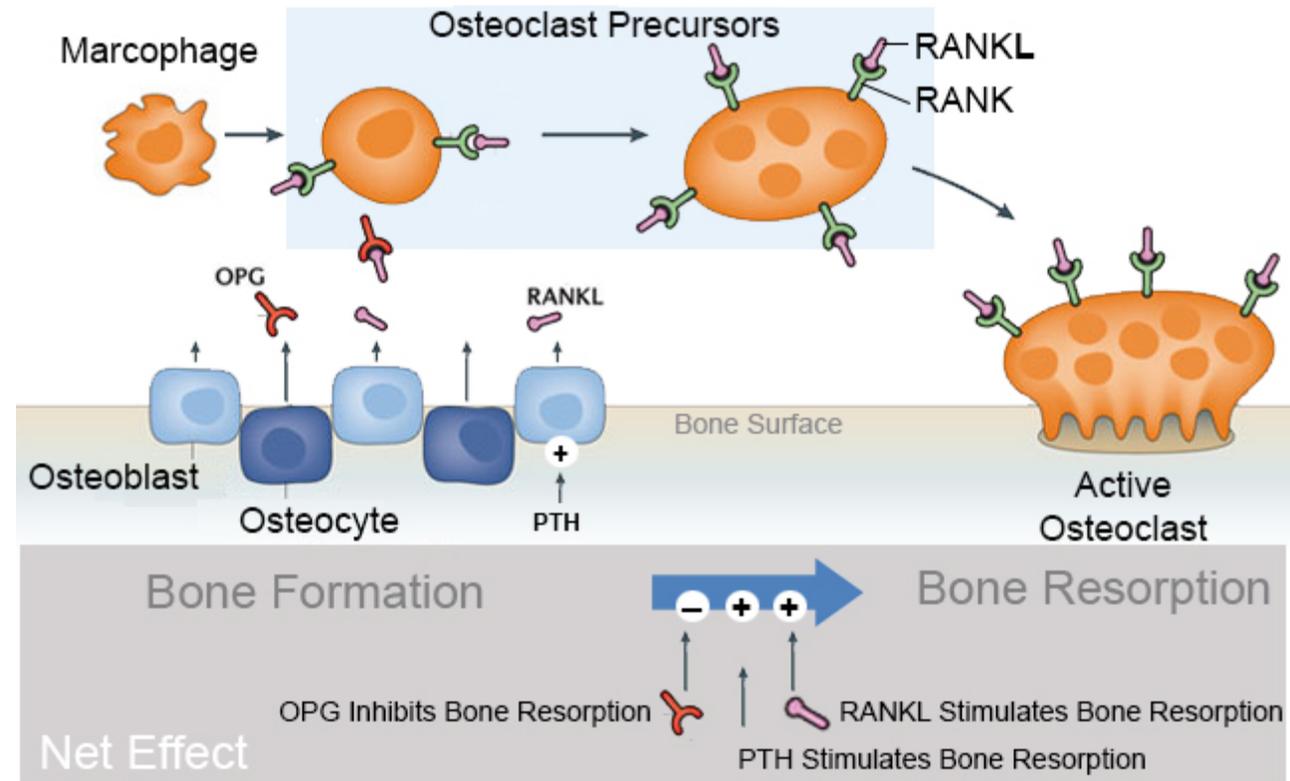

DEXA T-Scores

Osteopenia: -1 to -2.5
 Osteoporosis: ≤ -2.5

Bone signaling

Treatment

lifestyle modification

pharmacologic
treatment

rough -> border
osteoclast -> عُنُق
↓ bone resorption

calcium and
Vitamin D

Bisphosphonates

* Raloxifene → CA. breast tx

* Denosumab
monoclonal Ig

↓
it mimics
estrogen
(anabolic
role)

* Osteoporosis (quantitative bone loss)
↓ ECM
↓ organic
↓ inorganic

Osteomalacia (qualitative bone loss)
↳ only ↓ in inorganic matrix
↑ organic matrix (osteoid)

A metabolic bone disease where defective mineralization results in a large amount of unmineralized osteoid

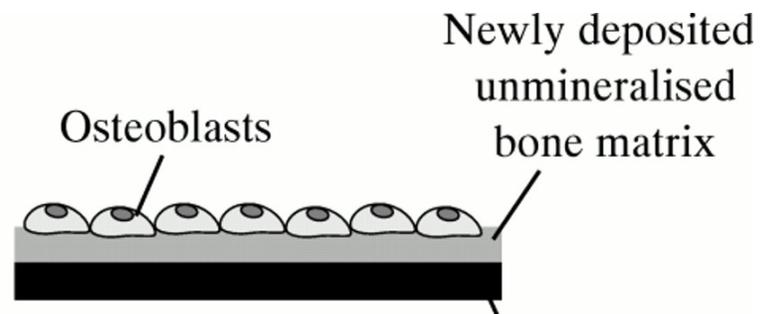

Osteomalacia = Rickets

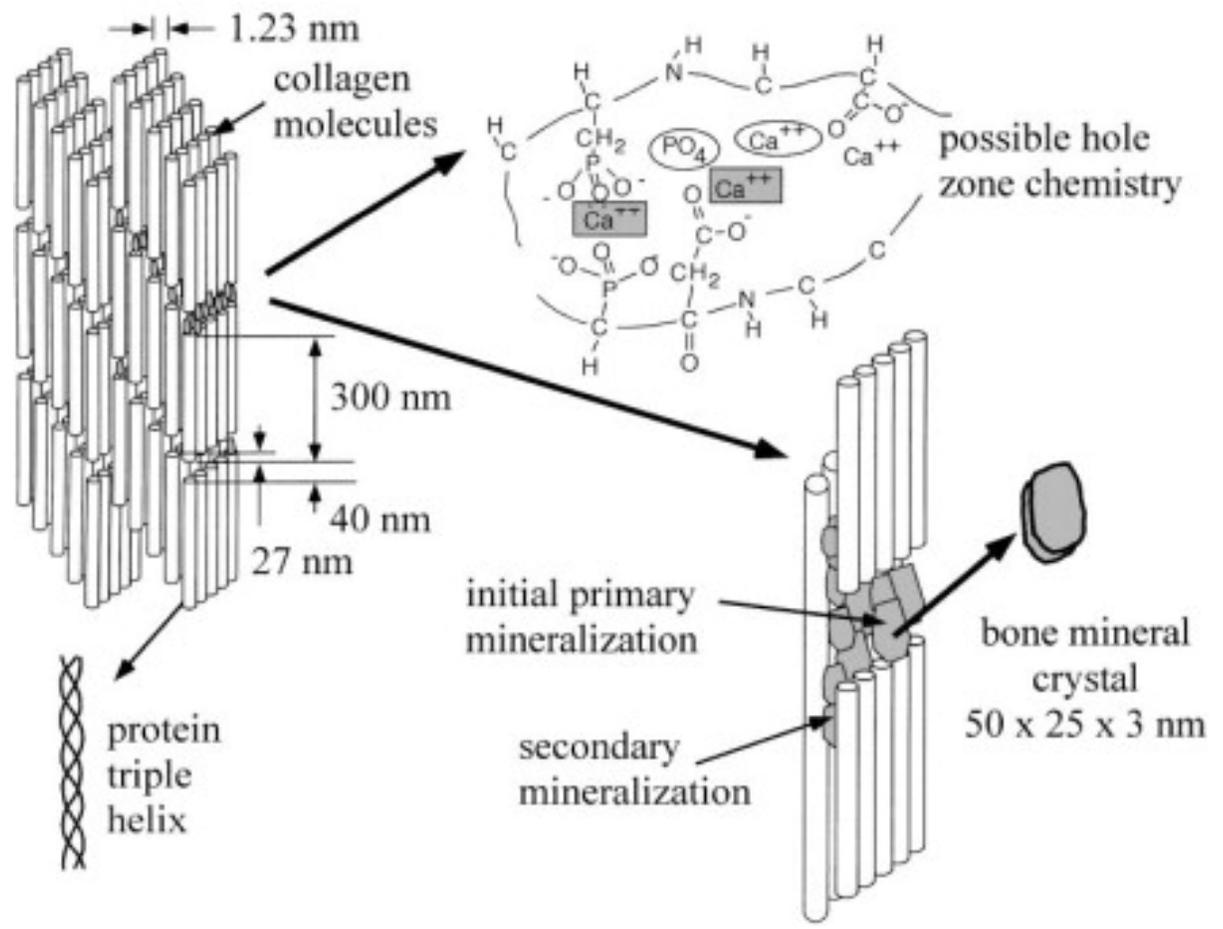

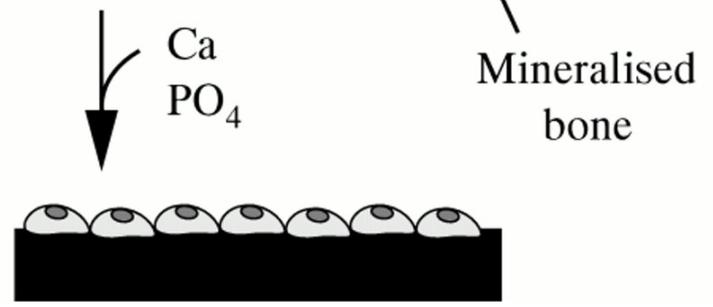

rickets is found in children (open physis)

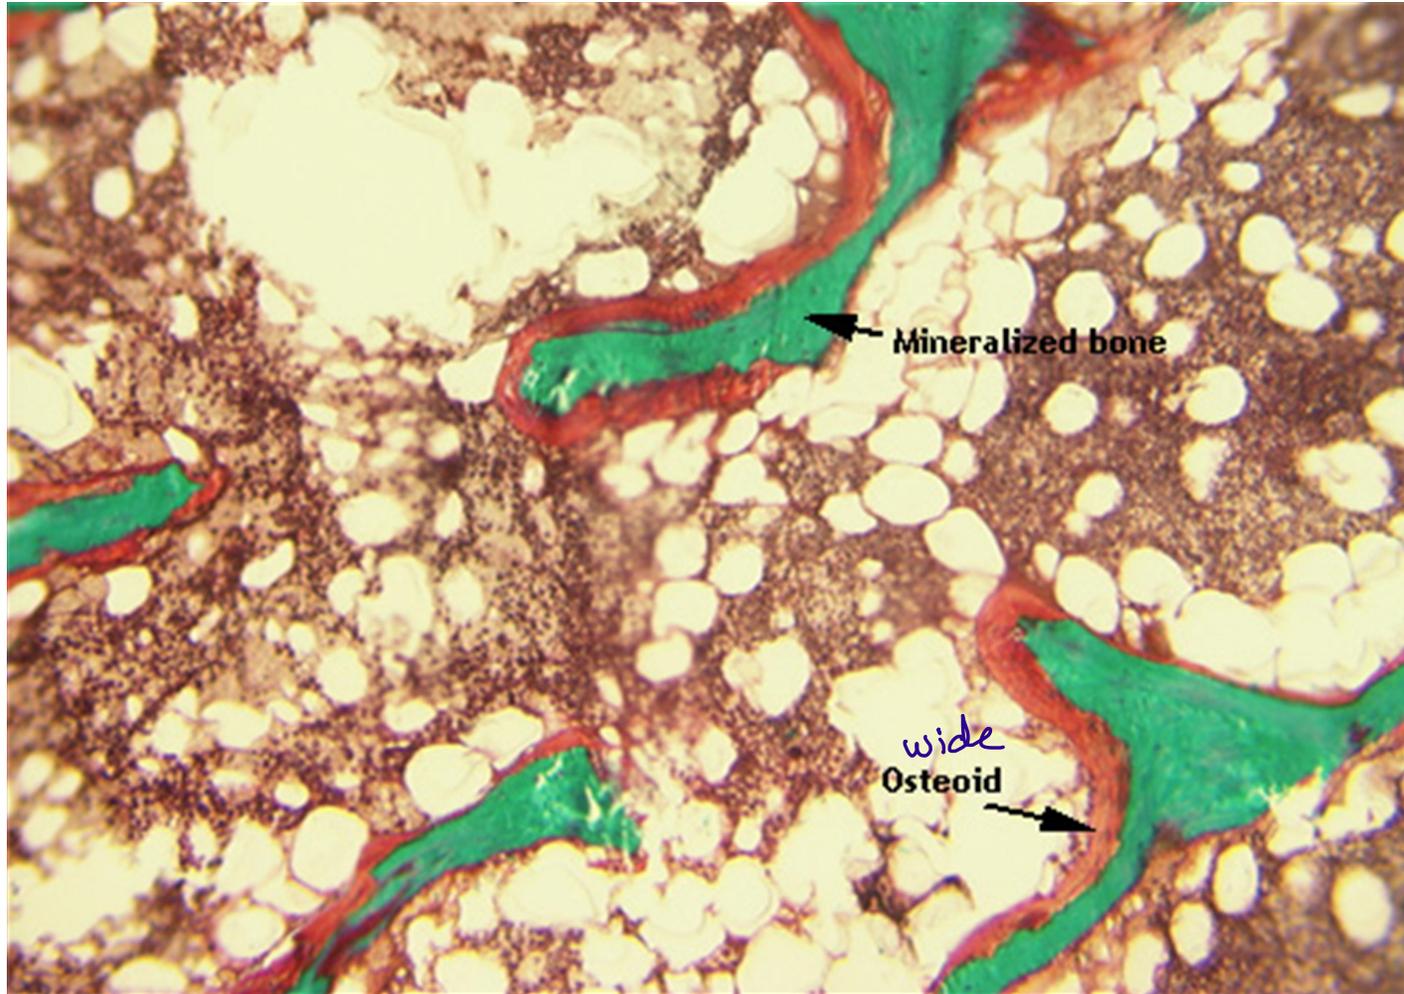

osteomalacia is found in adults (closed physis)

Step 1:
Deposition of
osteoid

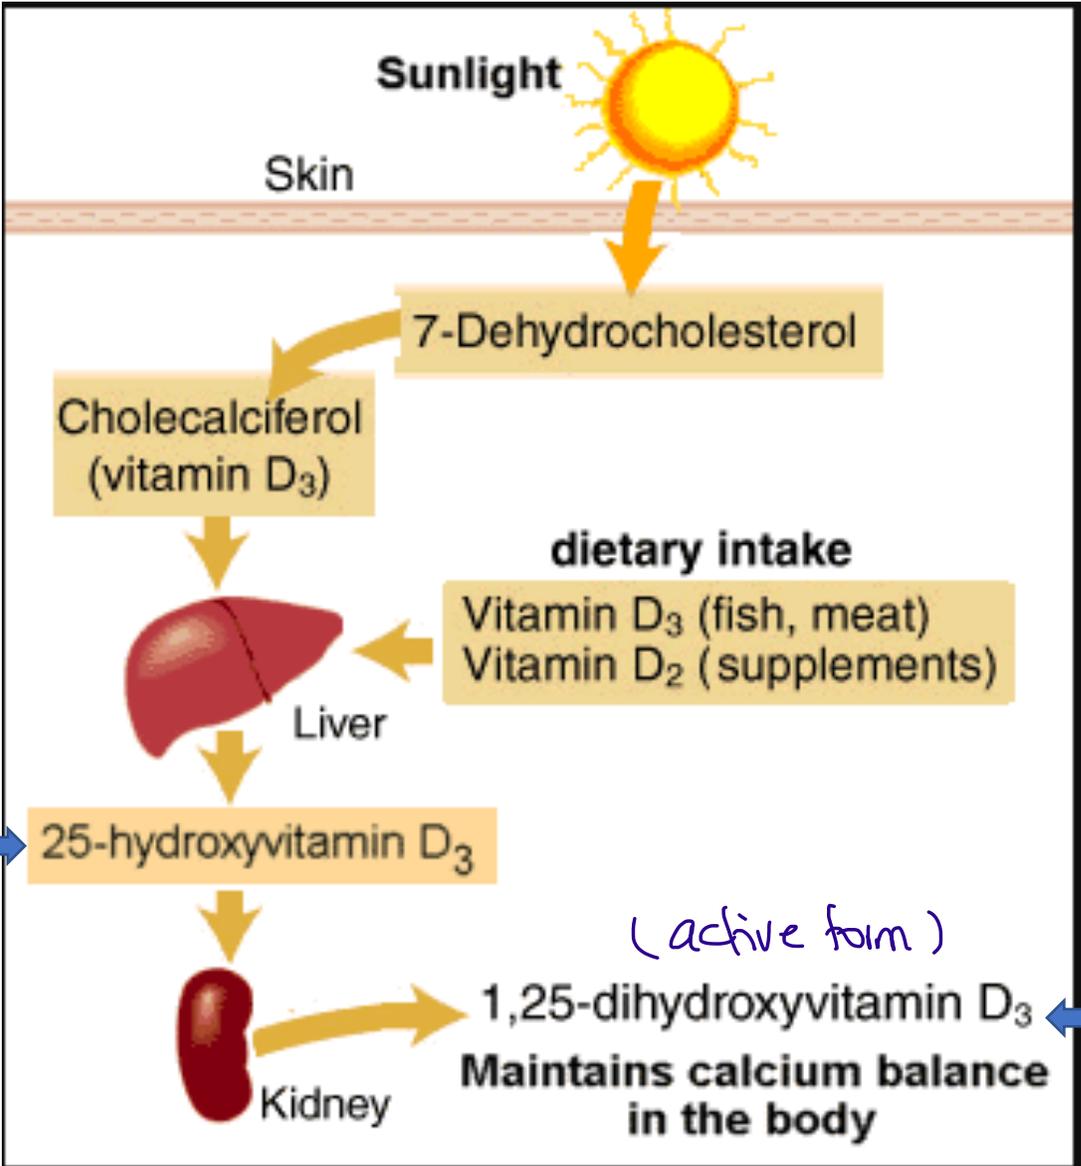

Step 2:
Mineralisation

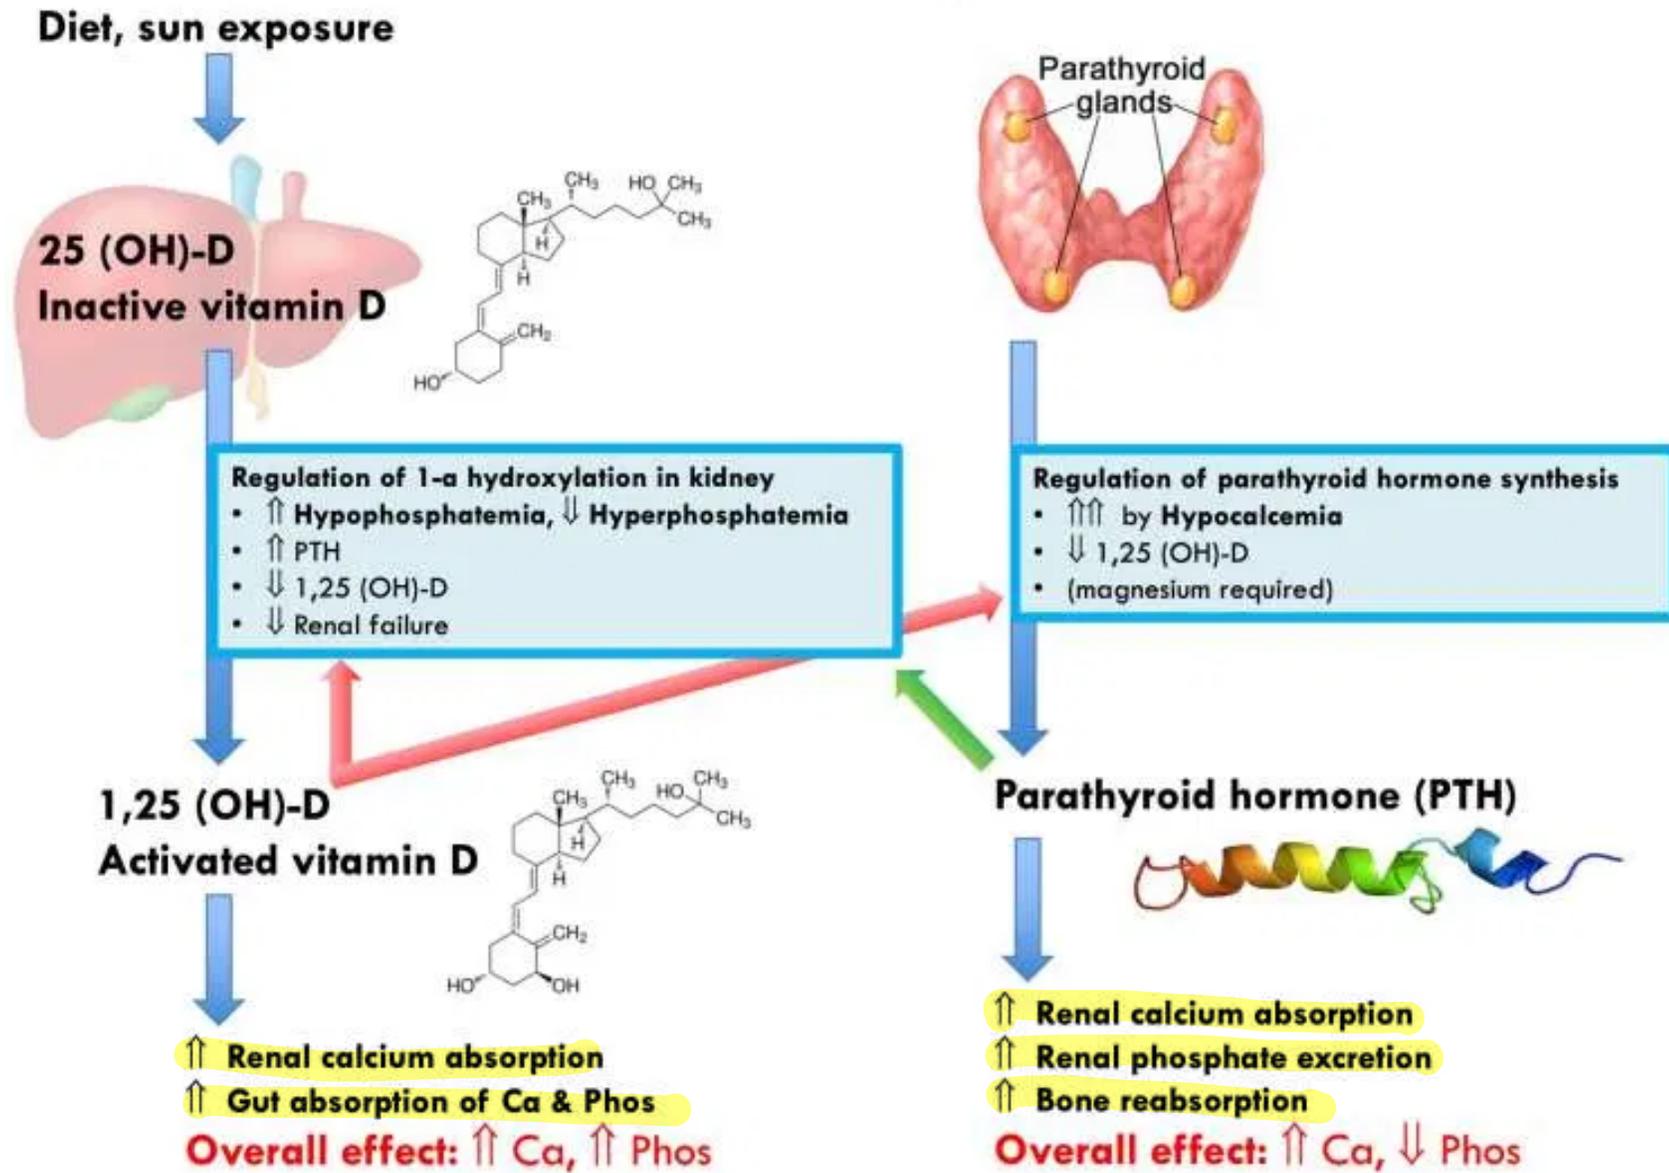

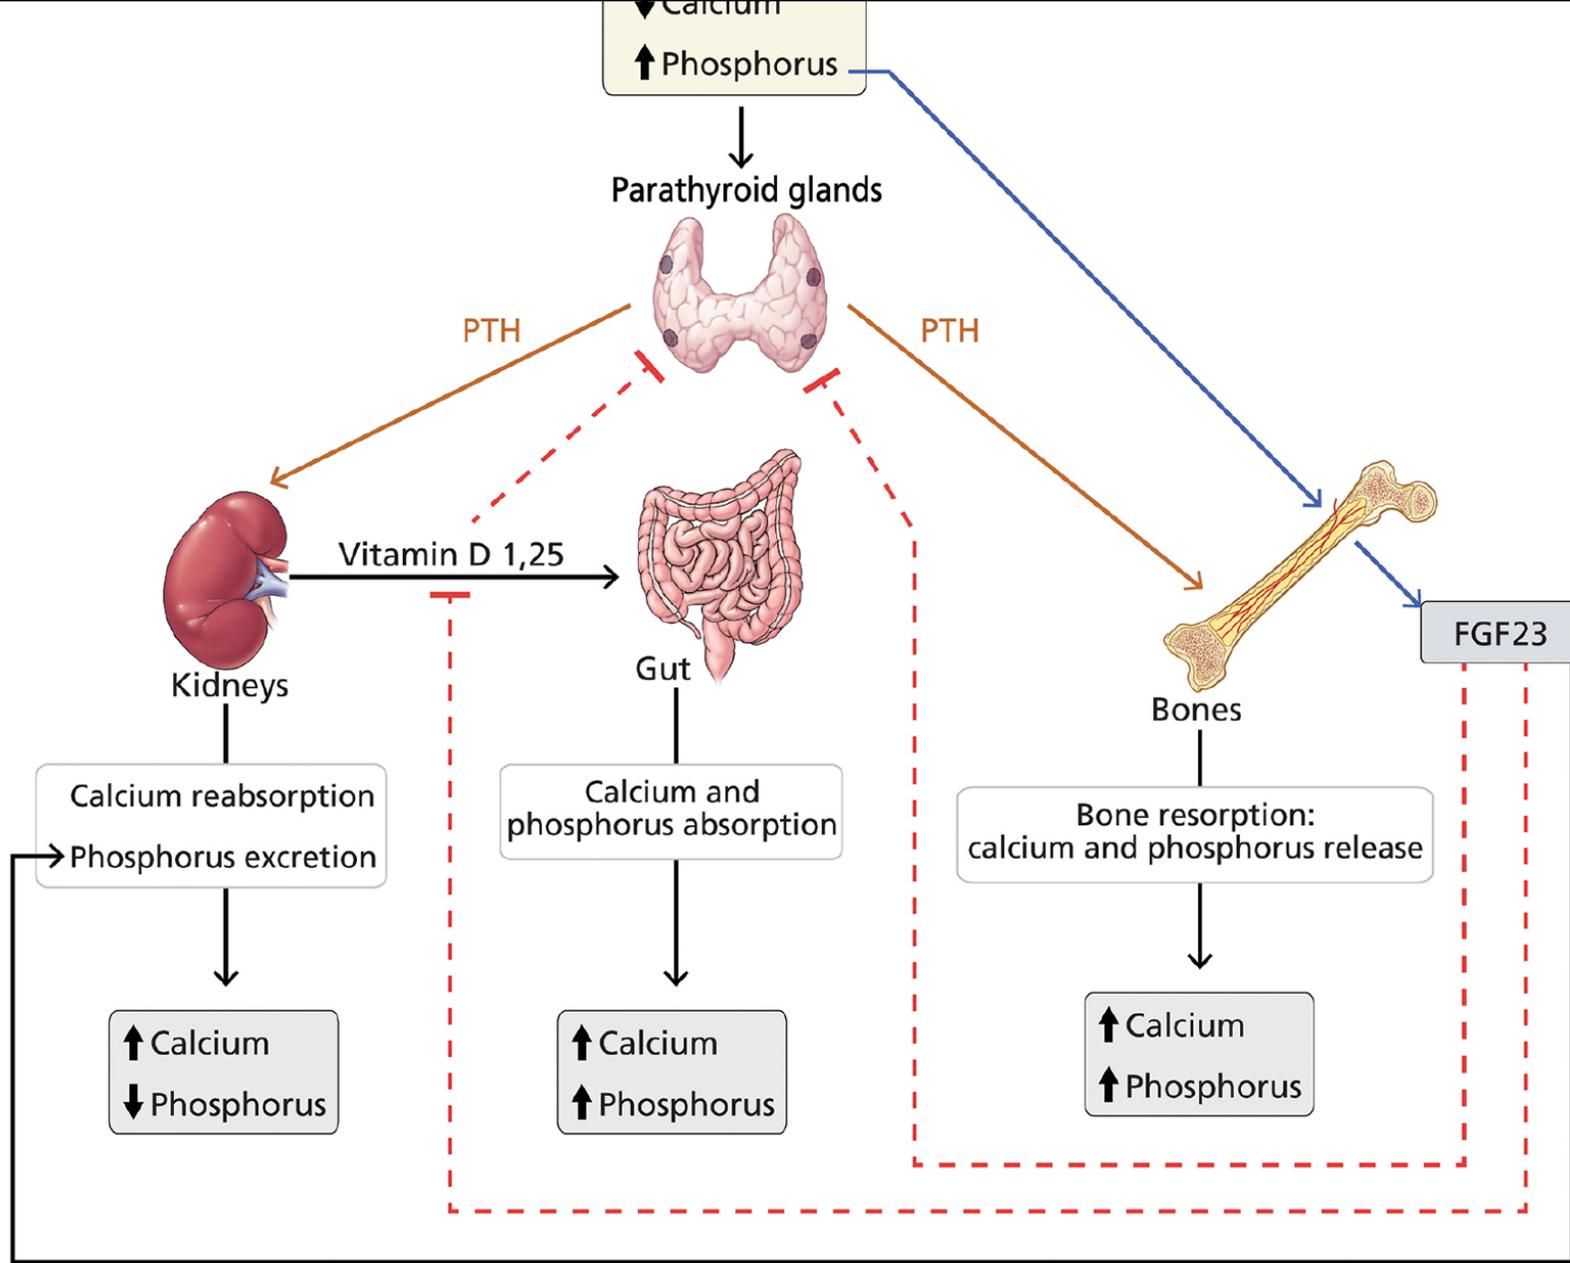

Mineralized bone

wide
Osteoid

Overview of Ca & Phos metabolism

↓ Ca or ↓ Poy

↓ mineralization
of bone

(inorganic matrix)
(hydroxyapatite)

risk factors

Vitamin-D deficient
diets

malabsorption e.g.
celiac disease

renal osteodystrophy

hypophosphatemia

chronic alcoholism

tumors (tumor-induced
osteomalacia)

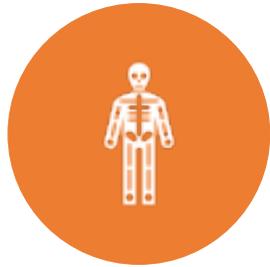

phosphatonin

↳ excretes phosphate

Drugs

- Phenytoin
- Glucocorticoids
- Ifosfamide
- etidronate

Symptoms

GENERALIZED BONE
AND MUSCLE PAIN

(stress)
FRACTURES OF LONG
BONES, RIBS AND
VERTEBRAE

PROXIMAL MUSCLE
WEAKNESS WEAKNESS

FATIGUE

Physical exam

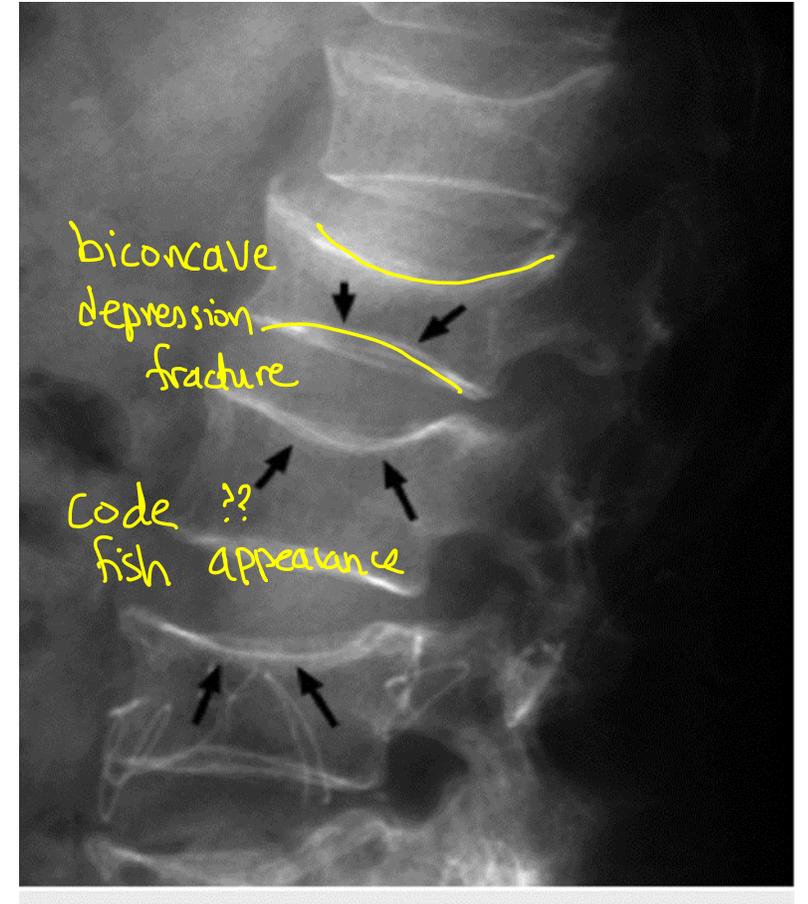

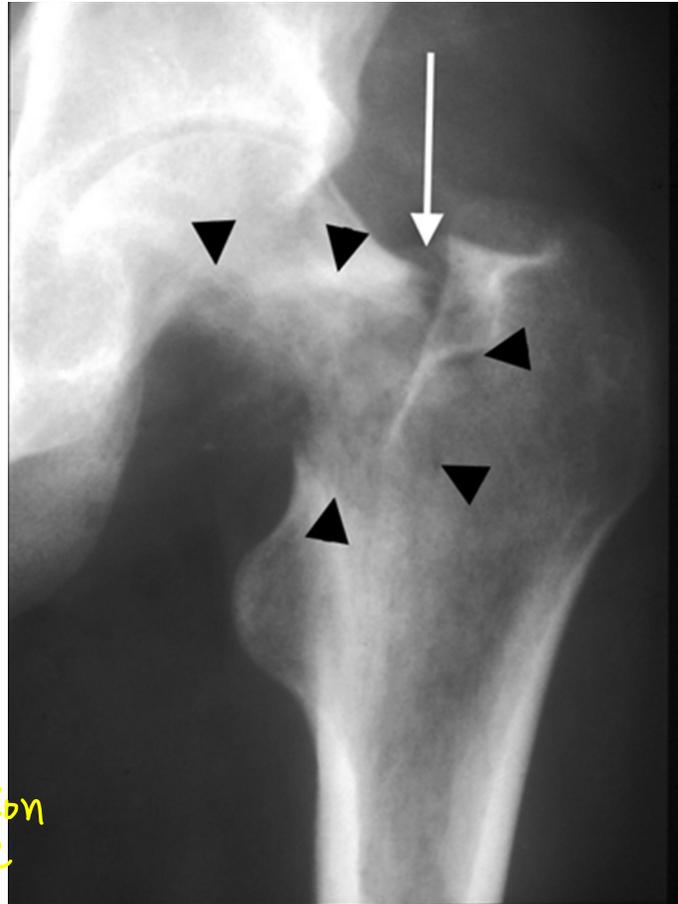

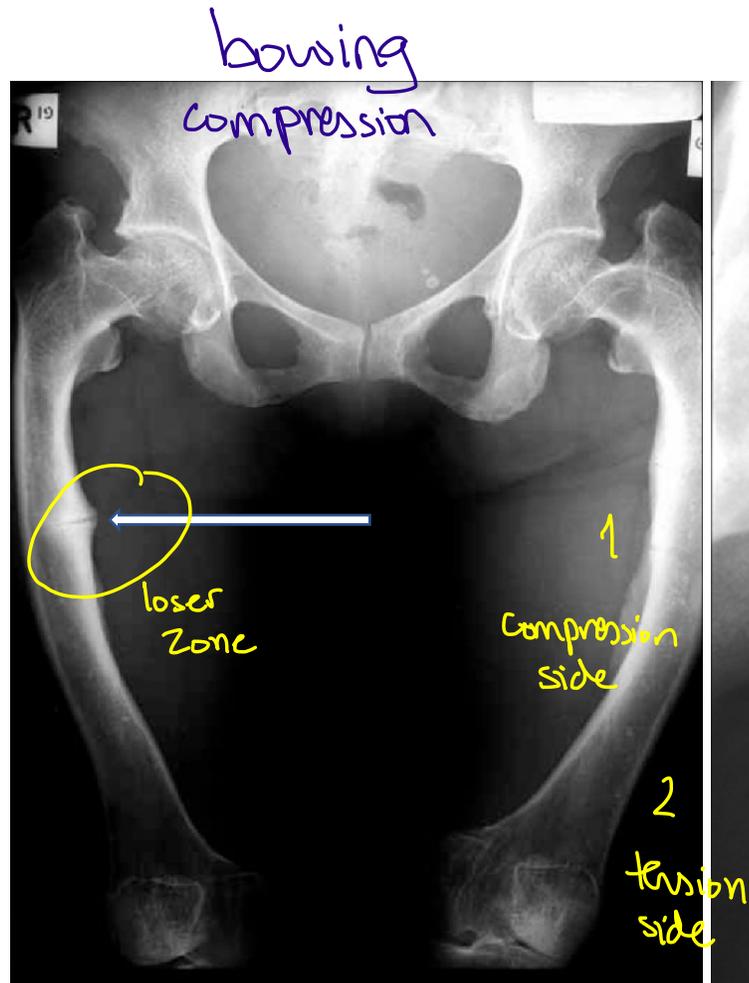

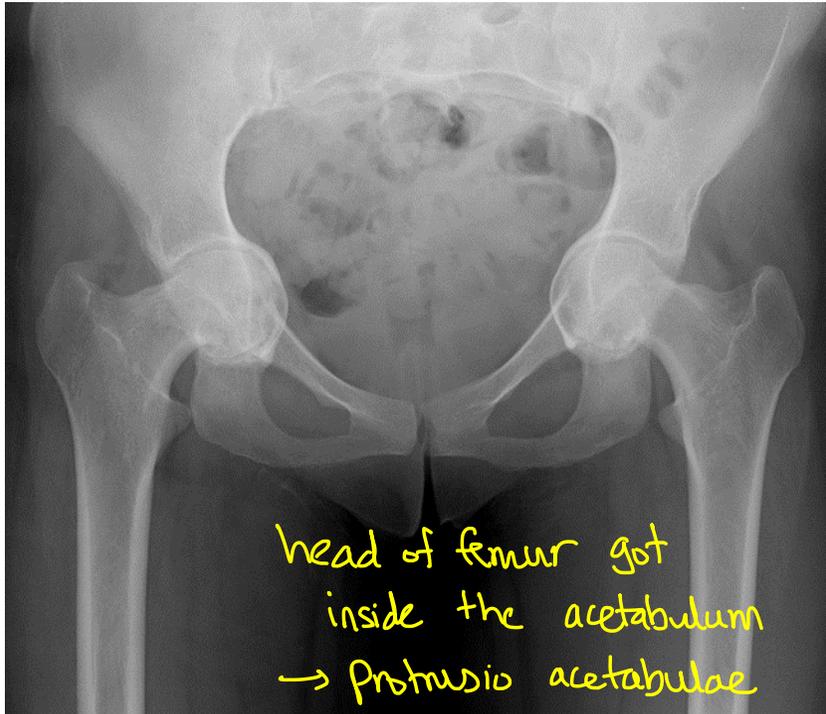

waddling gait

difficulty rising from
chair and climbing stairs

Imaging

Trefoil Pelvis

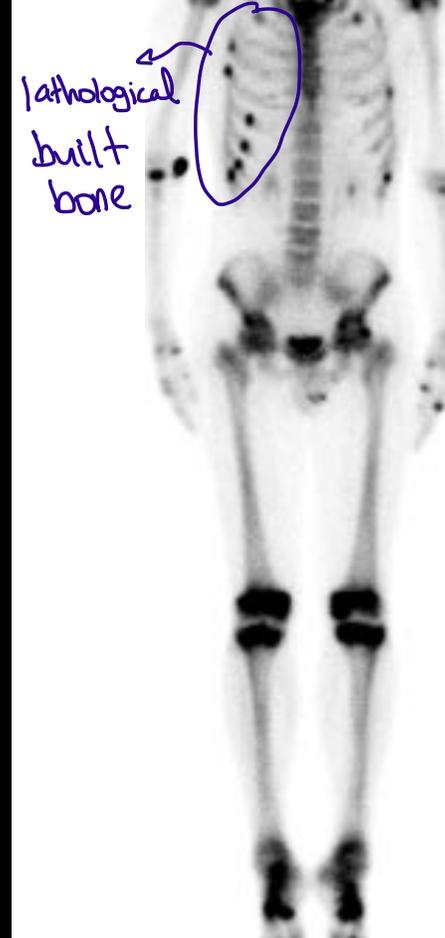

iliac wing
صايل أكثر من
الثاني

Bone scan

- Osteomalacia is an active process
 - ↳ osteoid is being formed but NOT mineralized.
 - as a compensation → more osteoid formation (active process)
- hot spots → symmetrical
- if unilateral → pathological
- Symmetrical bone density.
(hot nodules)

Osteomalacia pt.

A

after vit. D supplements (treated)

B

Treatment

large doses of oral vitamin D <sup>to ↑ Ca
↑ P_{OH}</sup>
(1000IU/day), treat underlying cause

Most Pts

specific subgroups of patients

on long-term
anticonvulsant therapy

- supplement with 400-800IU/day of vitamin D

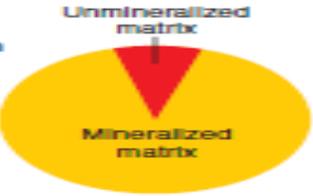

with hepatobiliary
disease

- supplement with 25(OH)-vit D

with renal disease

- supplement with 1,25(OH)₂ vit D

Comparison of Osteoporosis and Osteomalacia

	Osteoporosis	Osteomalacia	
Definition	 <p>Normal</p>	 <p>Bone mass decreased, mineralization normal</p>	 <p>Bone mass variable, mineralization decreased</p>
Age at onset	 <p>Generally in old age, after menopause</p>	 <p>Any age</p>	
Etiology	Endocrine abnormality, age, idiopathic cause, inactivity, disuse, alcoholism, calcium deficiency	Vitamin D deficiency, abnormality of vitamin D pathway, hypophosphatemic syndromes, renal tubular acidosis, hypophosphatasia	
Symptoms	 <p>Pain referable to fracture site</p>	 <p>Generalized bone pain</p>	
Signs	Tenderness at fracture site	Tenderness at fracture site and generalized tenderness	
Radiographic features	 <p>Axial predominance</p>	 <p>Appendicular predominance</p> <p>Often symmetric; pseudofractures or completed fractures</p>	
Laboratory findings			
Serum Ca^{2+}	Normal	Low or normal (high in hypophosphatasia)	
Serum P_i	Normal	Low or normal (high in renal osteodystrophy)	
Alkaline phosphatase	Normal	Elevated, except in hypophosphatasia	
Urinary Ca^{2+}	High or normal	Normal or low (high in hypophosphatasia)	
Bone biopsy	Tetracycline labels normal	Tetracycline labels abnormal	

indicates bone activity
(organic phosphate)

	Serum Ca	Serum P	Alk phos	PTH	25-(OH)vit D	1,25-(OH)vit D	Urinary Ca
Osteomalacia	low	low	high	high	low	low	low
Osteoporosis (NL labs)	normal	normal	variable	normal	normal	normal	normal
Tumor induced	low	very low	low	low	low	low	low

due to Phosphatonin

the tumor disrupted the normal bone (↓ bony activity)

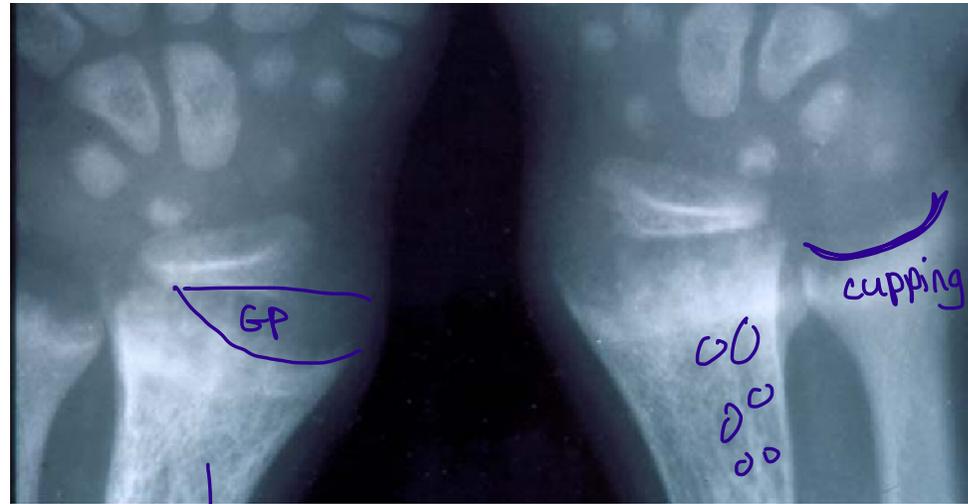

CLOSE-UP VIEW OF DEVELOPING EPIPHYSIS AND EPIPHYSEAL GROWTH PLATE

* Osteomalacia affects the hypertrophic zone of GP

ما يكبرو كثير بنفجرها
وعبرتها - بطلعوا ال Ca
من جوامع - calcification

No mineralization

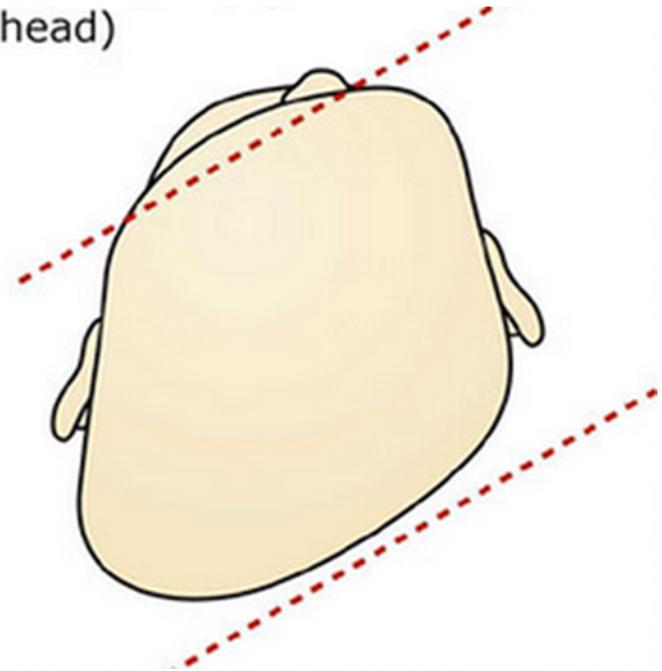

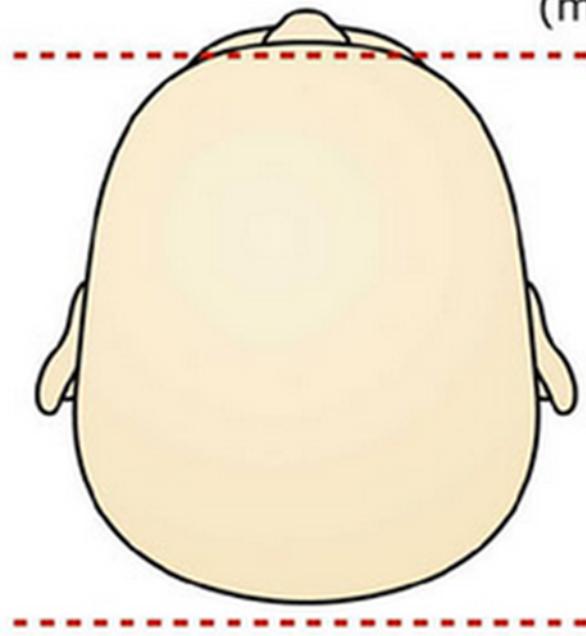

↓
ما كبر على
cupping

bowing

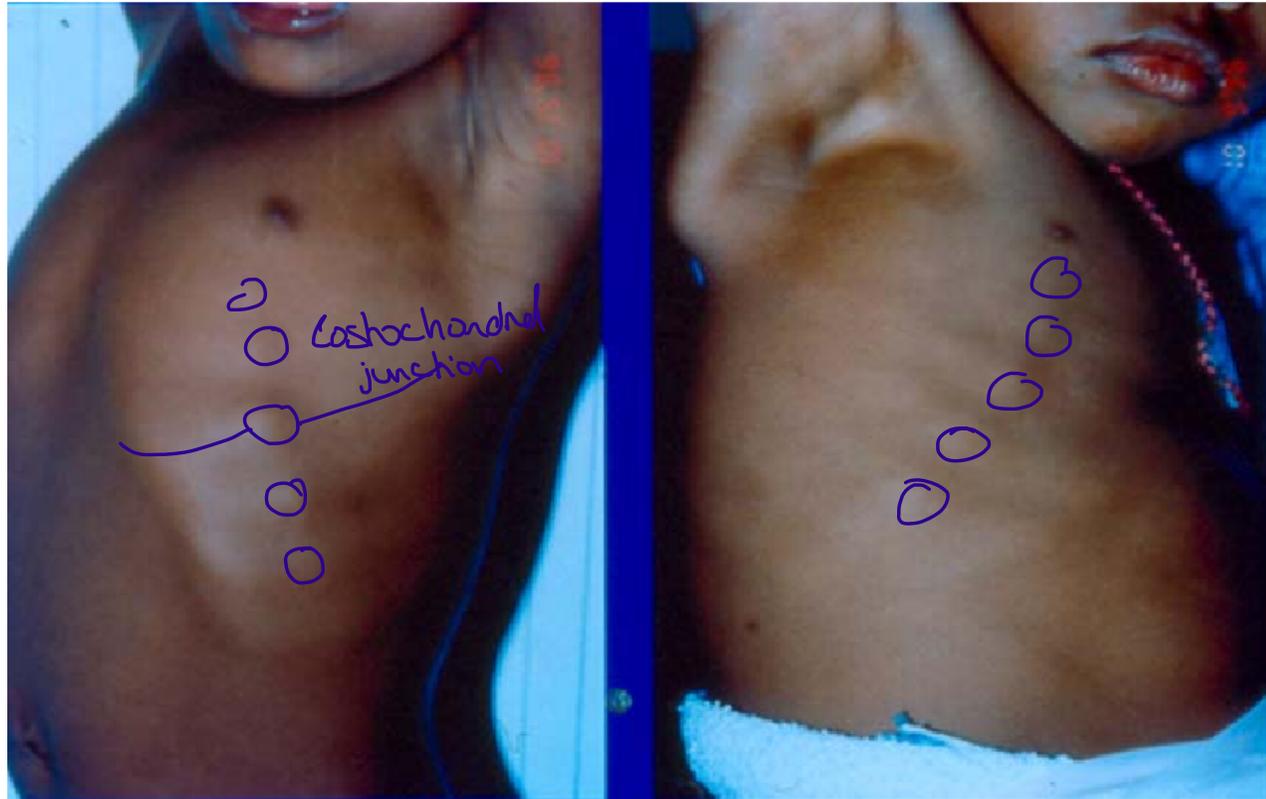

flat skull

(misshapen head)

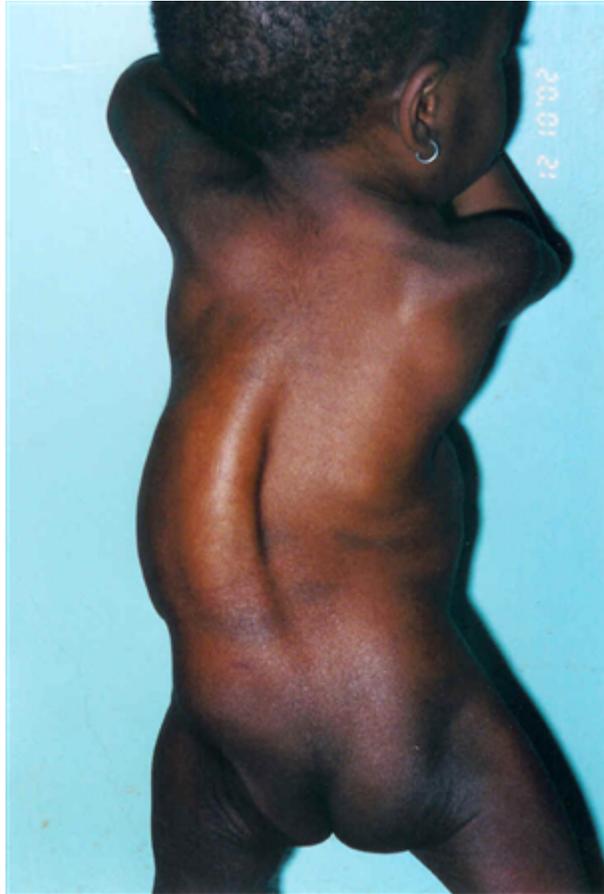

Rosary bead
sign

(Rachitic beads)

Kyphosis

* cat back

Classification

Rickets

Vitamin D-deficient
(nutritional)

Vitamin D-resistant
(familial
hypophosphatemic)

↳ disrupted renal
tubules (abnormal
PO₄ reabsorption)

Vitamin D-dependent

Other causes:
hypophosphatasia,
Renal osteodystrophy,
hyperparathyroidism

Alk
Phos
↑

Inability of renal
tubules to absorb
phosphate

I mutation in renal 25-
(OH)-1 α -hydroxylase

25 ↑ No 1,25-hydroxylase
1,25 ↓

II mutation in
intracellular receptor
for 1,25-(OH)₂-vitamin
D

↓ receptors of 1,25 (active form)
↑ 1,25 serum (compensation)

Condition	Genetics	Ca	Phos.	Alk Phos	PTH	Vit D	1,25 (OH)VitD
Vitamin D Resistant Rickets (Hypophosphatemic)	X linked dominant	-	↓	↑	-	-	
Vitamin D Deficiency Rickets (Nutritional)	Nutritional	-↓	↓	↑	↑	↓	
Type I Vitamin D Dependent	Auto. Recessive	↓	↓	↑	↑		↓ ↓
Type II Vitamin D Dependent	Auto. Recessive	↓	↓	↑			↑ ↑
Hypophosphatasia	Auto. Recessive	↑	↑	↓ ↓	-	-	
Renal Osteodystrophy	Renal Disease	↓	↑	↑	↑		
Hyperparathyroidism	90% adenoma	↑	↓	↑	↑		

Treatment

Calcitriol → active vit. D₃

phosphate replacement

Vitamin D

corrective surgery (severe bowing)
